Preface
Who is this book for?

Anyone who wants to get up to speed quickly with LibreOffice Draw will find this guide valuable. You may be new to drawing software, or you may be familiar with another program.

What is in this book?

This book introduces the main features of LibreOffice Draw. Draw is a vector graphics drawing tool, although it can also perform some operations on raster graphics (pixels) such as photographs. Using Draw, you can quickly create a wide variety of graphical images.

A few examples of the drawing functions are: layer management, snap functions and grid-point system, dimensions and measurement display, connectors for making organization charts, 3D functions that enable small three-dimensional drawings to be created (with texture and lighting effects), drawing and page-style integration, and Bézier curves.

The Draw Guide is not a course book to be worked through from beginning to end. Rather, it is a reference work in which you can browse for guidance on particular topics.

Where to get more help?

This guide, the other LibreOffice user guides, the built-in Help system, and user support systems assume that you are familiar with your computer and basic functions such as starting a program, opening and saving files.

Help system

LibreOffice comes with an extensive Help system. This is your first line of support for using LibreOffice.

To display the full Help system, press F1 or go to Help > LibreOffice Help on the main menu bar. In addition, you can choose whether to activate Tips, Extended tips, and the Help Agent by going to Tools > Options > LibreOffice > General on the main menu bar.

If Tips are enabled, place the mouse pointer over any of the icons to see a small box (tooltip) with a brief explanation of the icon function. For a more detailed explanation, select Help > What's This? On the main menu bar and hold the pointer over the icon.

Free online support

The LibreOffice community not only develops software, but provides free, volunteer-based support. See Table 1 and this web page: http://www.libreoffice.org/get-help/

Users can get comprehensive online support from the community through mailing lists and the Ask LibreOffice website, http://ask.libreoffice.org/en/questions/. Other websites run by users also offer free tips and tutorials. This forum provides community support for LibreOffice: http://en.libreofficeforum.org/.

This site provides support for LibreOffice and other programs: http://user.services.openoffice.org/en/forum/.

Paid support and training

Alternatively, you can pay for support services. Service contracts can be purchased from a vendor or consulting firm specializing in LibreOffice.

What you see may be different

Illustrations
LibreOffice runs on Windows, Linux, and Mac OS X operating systems, each of which has several versions and can be customized by users (fonts, colors, themes, window managers). The illustrations in this guide were taken from a variety of computers and operating systems. Therefore, some illustrations will not look exactly like what you see on your computer display.

Also, some of the dialogs may be differ because of the settings selected in LibreOffice. You can either use dialogs from your computer system (default) or dialogs provided by LibreOffice. To change to using LibreOffice dialogs:

1) On Linux and Windows operating systems, go to **Tools > Options > LibreOffice > General** on the main menu bar to open the dialog for general options.
   On a Mac operating system, go to **LibreOffice > Preferences > General** on the main menu bar to open the dialog for general options.

2) Select **Use LibreOffice dialogs in Open/Save dialogs and/or Print dialogs** to display the LibreOffice dialogs on your computer display.

3) Click **OK** to save your settings and close the dialog.

Icons
The icons used to illustrate some of the many tools available in LibreOffice may differ from the ones used in this guide. The icons in this guide have been taken from a LibreOffice installation that has been set to display the Galaxy set of icons.

If you wish, you can change your LibreOffice software package to display Galaxy icons as follows:

1) On Linux and Windows operating systems, go to **Tools > Options > LibreOffice > View** on the main menu bar to open the dialog for view options.
On a Mac operating system, go to **LibreOffice > Preferences > View** on the main menu bar to open the dialog for view options.

2) In *User interface > Icon size and style* select *Galaxy* from the options available in the drop down list.

3) Click **OK** to save your settings and close the dialog.

---

### Note

Some Linux operating systems, for example Ubuntu, include LibreOffice as part of the installation and may not include the Galaxy icon set. You should be able to download the Galaxy icons from the software repository for your Linux operating system.

---

### Using LibreOffice on a Mac

Some keystrokes and menu items are different on a Mac from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this chapter. For a more detailed list, see the application Help.

### What are all these things called?

The terms used in LibreOffice for most parts of the *user interface* (the parts of the program you see and use, in contrast to the behind-the-scenes code that actually makes it work) are the same as for most other programs.

A *dialog* is a special type of window. Its purpose is to inform you of something, or request input from you, or both. It provides controls for you to use to specify how to carry out an action. The technical names for common controls are shown in Figure 1; not shown is the list box (from which you select an item). In most cases we do not use the technical terms in this book, but it is useful to know them because the Help and other sources of information often use them.

1) Tabbed page (not strictly speaking a control).
2) Radio buttons (only one can be selected at a time).
3) Checkbox (more than one can be selected at a time).
4) Spin box (click the up and down arrows to change the number shown in the text box next to it, or type in the text box).
5) Thumbnail or preview.
6) Drop-down list from which to select an item.
7) Push buttons.
In most cases, you can interact only with the dialog (not the document itself) as long as the dialog remains open. When you close the dialog after use (usually, clicking **OK** or another button saves your changes and closes the dialog), then you can again work with your document.

Some dialogs can be left open as you work, so you can switch back and forth between the dialog and your document. An example of this type is the Find & Replace dialog.

**Who wrote this book?**

This book was written by volunteers from the LibreOffice community. Profits from sales of the printed edition will be used to benefit the community.

**Acknowledgements**

This book is adapted and updated from *OpenOffice.org 3.3 Draw Guide*. The contributors to that book are:

Frequently asked questions

How is LibreOffice licensed?
LibreOffice is distributed under the Open Source Initiative (OSI) approved Lesser General Public License (LGPL). The LGPL license is available from the LibreOffice website: http://www.libreoffice.org/download/license/

May I distribute LibreOffice to anyone?
Yes.

How many computers may I install it on?
As many as you like.

May I sell it?
Yes.

May I use LibreOffice in my business?
Yes.

Is LibreOffice available in my language?
LibreOffice has been translated (localized) into over 40 languages, so your language probably is supported. Additionally, there are over 70 spelling, hyphenation, and thesaurus dictionaries available for languages, and dialects that do not have a localized program interface. The dictionaries are available from the LibreOffice website at: www.libreoffice.org.

How can you make it for free?
LibreOffice is developed and maintained by volunteers and has the backing of several organizations.

How can I contribute to LibreOffice?
You can help with the development and user support of LibreOffice in many ways, and you do not need to be a programmer. For example, you can help with producing and maintaining written user documentation, producing video tutorials, and other user support services. To start, check out this webpage: http://www.documentfoundation.org/contribution/

May I distribute the PDF of this book, or print and sell copies?
Yes, as long as you meet the requirements of one of the licenses in the copyright statement at the beginning of this book. You do not have to request special permission. In addition, we request that you share with the project some of the profits you make from sales of books, in consideration of all the work we have put into producing them.
Chapter 1
Introducing Draw
Introduction

Draw is a vector graphics drawing tool, although it can also perform some operations on raster graphics (pixels) such as photographs. Using Draw, you can quickly create a wide variety of graphical images.

Vector graphics store and display a picture as simple geometric elements such as lines, circles, and polygons rather than as a collection of pixels (picture elements or points on the screen). This permits simpler storage and supports precise scaling of the picture elements.

Draw is fully integrated into the LibreOffice suite and this simplifies exchanging graphics with all components of the suite. For example, if you create an image in Draw, reusing it in a Writer document is as simple as copying and pasting the image. You can also work with drawings directly from within Writer or Impress using a subset of the functions and tools from Draw.

The functionality of LibreOffice Draw is extensive and, even though it was not designed to rival high-end graphics applications, it possesses significantly more functionality than the drawing tools that are generally integrated with most office productivity suites.

A few examples of the drawing functions are: layer management, magnetic grid-point system, dimensions and measurement display, connectors for making organization charts, 3D functions that enable small three-dimensional drawings to be created (with texture and lighting effects), drawing and page-style integration, and Bézier curves.

This Draw Guide is not a course book to be worked through from beginning to end. Rather, it is a reference work in which you can browse for guidance on particular topics.

This document describes only the functions associated with Draw. Some concepts, such as file management or the way the LibreOffice environment works, are mentioned only briefly; they are covered in more detail in the Getting Started Guide.

Draw workplace

The main components of the Draw interface or workspace are shown in Figure 2.

The large area in the center of the window is where you make the drawings. You can surround the drawing area with toolbars and information areas. The number and position of the visible tools vary with the task in hand and user preferences. Therefore your setup may look different. For example, many users put the main Drawing toolbar on the left-hand side of the workspace and not at the bottom, as shown in Figure 2.

You can split drawings in Draw over several pages. Multi-page drawings are used mainly for presentations. The Pages pane, on the left side of the Draw workspace in Figure 2 gives an overview of the pages that you create. If the Pages pane is not visible on your setup, you can enable it by going to View > Page Pane on the main menu bar. To make changes to the page order, just drag and drop one or more pages into a new position.

In LibreOffice Draw, the maximum size of a drawing page is 300 cm by 300 cm.

Rulers

You should see rulers (bars with numbers) on the upper and left-hand sides of the workspace. If they are not visible, you can enable them by selecting View > Ruler in the main menu bar. The rulers show the size of a selected object on the page using double lines (highlighted in Figure 3). When no object is selected, they show the location of the mouse pointer, which helps to position drawing objects more accurately.

You can also use the rulers to manage object handles and guide lines, making it easier to position objects.
Chapter 1  Introducing Draw

The page margins in the drawing area are also represented on the rulers. You can change the margins directly on the rulers by dragging them with the mouse. The margin area is indicated by the grayed out area on the rulers as shown in Figure 3.

To modify the measurement units of the rulers, which can be defined independently, right-click on the desired ruler, as illustrated for the horizontal ruler in Figure 4.
The default position of the zero for each of the rulers is located in the top left corner of the page where the left and top margins start. This zero position can be adjusted by holding down the Ctrl key and clicking in the top left corner of the workspace (Figure 3) where the horizontal and vertical rulers meet and dragging to a new zero position.

**Status bar**

The Status bar is located at the bottom of the Draw window and includes several Draw-specific fields.

- **Information area** shows which action is being carried out, or which object type is selected. **Position** and **Object size** show different information depending on whether objects are selected or not.
  - When no object is selected, the position numbers show the current position (X and Y coordinates) of the mouse cursor.
  - When an object is selected and being resized with the mouse, the object size numbers show the size of the object (width and height).

  The sizes are given in the current measurement unit (not to be confused with the ruler units). This measurement unit is defined in **Tools > Options > LibreOffice Draw > General**.

  - If an object is selected, the position numbers shows the X and Y coordinates of the upper-left corner and the object size number pair displays the size of the object. These numbers do not relate to the object itself, but to the selection outline, which is the smallest possible rectangle that can contain the visible part or parts of the object; see **Chapter 3 Working with Objects and Object Points** for more information.
When an object is selected, a double-click in either of these areas opens the **Position and Size** dialog; see *Chapter 4 Changing Object Attributes* for more information.

- **Unsaved changes** are indicated whenever any change is made to the document but not yet saved to disk.
- **Digital signature** indicates if the document has been digitally signed. A double-click or right-click in this area opens the Digital Signatures dialog. A document must be saved at least once before it can be digitally signed. After a document is digitally signed, an indicator appears in this area.
- **Slide number** shows the sequence number for the current drawing page and the total number of pages created for the drawing. If you select an object, the information enclosed by parentheses indicates on which layer the object is placed within the drawing. In the example shown in Figure 5, the object is on the Layout layer of Slide 1 and there is a total number of one slide in the drawing.
- **Page style** shows which template is being used for the drawing.
- **Zoom slider** changes the zoom percentage of how the drawing appears on the computer display. Clicking on the plus (+) sign increases zoom and on the minus (-) sign decreases zoom. You can also drag the slider to increase or decrease the zoom percentage. The vertical bar in the middle of the **Zoom** slider represents a zoom percentage of 100%.
- **Zoom percentage** shows the level of zoom as a percentage. Double-clicking on the zoom percentage opens the **Zoom & View Layout** dialog. Right-clicking on the zoom percentage opens a menu where you can select a zoom level. See *Chapter 3 Working with Objects and Object Points* for more information on working with the zoom functions.

**Toolbars**

You can display or hide the various Draw toolbars, according to your needs. To display or hide a toolbar, click **View > Toolbars**. On the menu that appears, select which toolbars you want to display.

You can also select the icons or buttons that you want to appear on the toolbars. To change the visible icons or buttons on any toolbar, right-click in an empty area on the toolbar and select **Visible Buttons** from the context menu. Visible icons or buttons are indicated by a shaded outline around the icon. Icons or buttons not visible are indicated by a plain icon as shown by the lower three icons in Figure 6. Click on an icon to hide or show it in the toolbar.

![Figure 6: Selection of visible toolbar icons](image)
**Standard toolbar**
The Standard toolbar (Figure 7) is the same for all LibreOffice components and is described in detail in the *Getting Started Guide*.

![Standard toolbar](image)

*Figure 7: Standard toolbar*

**Drawing toolbar**
The Drawing toolbar (Figure 8) is the most important toolbar in Draw. It contains all the necessary functions for drawing various geometric and freehand shapes, and for organizing them in the drawing. It is described in detail in *Chapter 2, Drawing Basic Shapes*.

![Drawing toolbar](image)

*Figure 8: Drawing toolbar*

**Line and Filling toolbar**
The Line and Filling toolbar (Figure 9) lets you modify the main properties of a drawing object. The icons and pull-down lists vary according to the type of object selected. For example, to change the style of a line, click on the up and down arrows for *Line Style* and select the required style.

The functions on the Line and Filling toolbar let you change the color, style, and width of the line drawn, the fill color and style, and other properties of an object. The object must first be selected with a mouse click. If the selected object is a text frame, the Line and Filling toolbar changes to the Text Formatting toolbar (Figure 10).

![Line and Filling toolbar](image)

*Figure 9: Line and Filling toolbar*

**Text Formatting toolbar**
The Text Formatting toolbar (Figure 10) is similar to the Formatting toolbar in Writer. For an explanation of the functions on this toolbar, see *Chapter 4 Changing Object Attributes*. For information on adding and formatting text, see *Chapter 9 Adding and Formatting Text*.

![Text Formatting toolbar](image)

*Figure 10: Text Formatting toolbar*

**Options toolbar**
Use the Options toolbar (Figure 11) to activate or deactivate various drawing aids. The Options toolbar is not displayed by default. To display it, go to *View > Toolbars > Options* on the main menu bar. The tools available on this toolbar are shown in Figure 11 and described in greater detail in other chapters of this *Draw Guide*.

![Options toolbar](image)

*Figure 11: Options toolbar*
Floating and moving toolbars

Available toolsets

Many icons have a small triangle pointing downward to the right side of the icon. This triangle indicates that the icon has additional tools available. Click on the triangle to display the full set of tools (Figure 12).

You can "tear off" this toolset so it becomes a floating toolbar. Click the area at the bottom of the toolset, drag it across the screen to a location you want and then release the mouse button. To close a floating toolbar, click on the X on the right of the toolbar title.

Note

When a toolset is made into a floating toolbar, the icon on the existing toolbar remains in the toolbar and always shows the last tool you used. This means that the icon you see on your screen may differ from the icon shown in this guide.
**Tip**
When you double-click on an icon on a toolbar, the command corresponding to that icon will become active and remain active. You can then repeat this action as often as you like. To exit from this mode, press the Esc key or click on another icon. Please note that this may not work for every icon on every toolbar.

**Default toolbars**
When you open Draw, the default set of toolbars are already docked or fixed in their positions at the top and bottom of the workspace. This default set of toolbars normally are the Standard, Line and Filling, and Drawing toolbars. These toolbars can be undocked and become floating toolbars.

- To undock a toolbar, move the mouse cursor to the far left of the toolbar and over the toolbar handle (Figure 13). The cursor will change shape, normally to a grabbing hand, but this is dependent on computer setup and operating system. Click and drag on the toolbar handle to move the toolbar until it becomes a floating toolbar. This floating-toolbar capability is common to all components of LibreOffice.
- To dock a floating toolbar at the top of the Draw workspace, press and hold the Ctrl key then double-click on the title of the toolbar. The toolbar will move into available space at the top of the Draw workspace.
- An alternative method of docking a toolbar is to click in the toolbar title and drag the toolbar to the docked position that you require. This can be the top, bottom or one of the sides of the Draw workspace.

![Figure 13: Toolbar handles](image)

**Customizing toolbars**
You can customize toolbars in several ways:

- To show or hide icons defined for a toolbar, see “Toolbars” and Figure 6 on page 17.
- To add functions to a toolbar, move tools between toolbars, or create new toolbars:
  1) Select View > Toolbars > Customize on the main menu bar to open the Customize dialog (Figure 14).
  2) Select the Toolbars tab and the toolbar you want to change from the Toolbar drop down list.
  3) Select the desired function for that toolbar from the Commands list.
  4) If necessary, reposition the new function on the Commands list using the up and down arrows.
  5) Click Toolbar and select how you want the toolbar to appear in Draw from the context menu – Icons Only, Text Only, Icons & Text, or Restore Default Settings.
  6) Click OK to save your changes and close the dialog.
- To add a new function, or modify a toolbar, see the Getting Started Guide for more information.
Choosing and defining colors

The Color bar (Figure 15) displays the current color palette. It lets you rapidly select the color of the various objects (lines, areas, and 3D effects) in your drawing. The first box in the panel corresponds to invisible (no color). If the Color bar is not displayed go to View > Toolbars > Color Bar. The toolbar appears by default at the bottom of the workspace and displays the current color palette.

You can access several specialized color palettes in Draw, as well as change individual colors to your own taste. This is done using the Colors page in the Area dialog by selecting Format > Area on the main menu bar or clicking the Area icon on the Line and Filling toolbar, then selecting the Colors tab (Figure 16).
To load another palette, click on the **Load Color List** icon 📁. The file selector dialog asks you to choose one of the standard LibreOffice palettes (files with the file extension *.soc). For example, web.soc is a color palette that is adapted to creating drawings for placing in web pages. These colors will display correctly on workstations with screens capable of at least 256 colors.

The color selection box also lets you individually change any color by modifying the numerical values in the fields provided to the right of the color palette. You can use the color schemes known as CMYK (Cyan, Magenta, Yellow, Black) or RGB (Red, Green, Blue).

Click on the **Edit** button to open the Color dialog, where you can set individual colors. See the *Getting Started Guide Chapter 2 Setting Up LibreOffice* for more information. A more detailed description of color and options can also be found in *Chapter 10 Advanced Draw Techniques* in this guide.

### Grid, snap, and help lines

Draw provides a grid and snap lines as drawing aids and these can be turned on or off by clicking on the **Display Grid** or **Display Snap Lines** icons on the Options toolbar. The grid and snap lines are displayed only on the screen and are not shown on a printed drawing or when the drawing is used in another LibreOffice program. The color, spacing and resolution of the grid points can be individually chosen for each axis.

Help lines when moving objects can be displayed and these are turned on or off by clicking on the **Helplines While Moving** icon on the Options toolbar. Showing the position of the object while moving it makes positioning the object much easier. If this function is activated, pairs of vertical and horizontal lines enclosing the object are shown while moving the object. These lines extend to the edges of the drawing area.

Draw also offers several snap functions to help you can position objects exactly in a drawing.

For more information on the grid, snap lines, snap functions, and help lines, see *Chapter 3 Working with Objects and Object Points*.
Chapter 2
Drawing Basic Shapes
Introduction

You can create 2D and 3D objects in Draw. This chapter shows how to draw simple 2D objects. The following chapters describe how to work with and edit such objects. For more information on 3D objects, see Chapter 7 Working with 3D Objects.

All shapes, whether they are lines, rectangles, or more complicated shapes, are called objects. This is common notation in vector drawing software.

The drawing tools are found on the Drawing toolbar (Figure 17). This toolbar is normally located at the bottom of the workspace. If you do not see it, you can activate it by going to View > Toolbars on the main menu bar.

As with all the components of LibreOffice, you can undock the Drawing toolbar and place it wherever you want to on the Draw workspace as a floating toolbar. You can also configure toolbars by adding, moving, hiding, or deleting toolbar icons. See Chapter 1 Introducing Draw for more information.

When you draw a shape, select one for editing or add text, the Information field in the status bar (Figure 18) changes to reflect the action taken or in progress. See Chapter 1 Introducing Draw for more information on the status bar.

Custom shapes

Draw also offers the ability to create custom shapes, which are the equivalent of AutoShapes in Microsoft Office. Custom shapes differ in their properties and are dealt with separately in the relevant chapters of this guide. The main differences relate to the behavior of 3D objects and text handling. Text frames in Draw have their own geometric format.

Drawing basic shapes

Basic shapes, including text, are treated as objects in Draw. The standard set of tools available for drawing basic shapes, from left to right on the Drawing toolbar, are shown in Figure 19.

The tools that are already placed on the Drawing toolbar are indicated by a darkened area around the icon, for example Select, Line and so on. The tools not on the Drawing toolbar do not have this darkened area around the icon, for example To Curve, To Polygon, and so on.
Please note that some of the icons on the Drawing toolbar will change shape according to the last tool used from the selection of available tools. The icons that have a small triangle to the right of the icon indicates that more tools are available. See “Drawing geometric shapes” on page 34 for information on the available shapes.

<table>

<tbody>
<tr>
<td>When you draw a basic shape or select one for editing, the information area at the left side in the status bar changes to reflect the present action: for example Line created, Text frame xxyy selected, and so on.</td>
</tr>
</tbody>
</table>

**Figure 20: A straight line**

**Straight lines**

A straight line is the simplest element or object in Draw to create.

1) Click on the **Line** icon on the Drawing toolbar and place the cursor at the point where you want to start the line (Figure 20).
2) Click and drag the cursor while keeping the mouse button pressed.
3) Release the mouse button at the point where you want to end the line. A selection handle appears at each end of the line, showing that this object is the currently selected object. The selection handle at the starting point of the line is slightly larger than the ending selection handle.

4) Keep the Shift key pressed while you draw a line to restrict the drawing angle of the line to a multiple of 45 degrees (0, 45, 90, 135, and so on).

Note

This is the default behavior of the Shift key. However, if the option When creating or moving objects in the Snap position section of Tools > Options > LibreOffice Draw > Grid has been selected, the action of the Shift key is the opposite. Lines will automatically be drawn at a multiple of 45 degrees unless the Shift key is pressed.

5) Keep the Ctrl key pressed while drawing a line to enable the end of the line to snap to the nearest grid point.

Note

This is the default behavior of the Ctrl key. However, if the Snap to Grid option on the View->Grid menu has been selected, the Ctrl deactivates the snap to grid activity.

6) Keep the Alt key pressed while drawing a line and the line extends outwards symmetrically in both directions from the start point. This lets you draw lines starting from the middle of the line.

7) When a line is drawn, it uses default attributes. To change any of these attributes, select the line by clicking on it, then use the tools on the Line and Filling toolbar to change line style, line width or line color.

8) Alternatively, go to Format > Line on the main menu bar, or right-click and select Line from the context menu to open the Line dialog (Figure 21) to change line style, line width, line color or line transparency.

9) If necessary, go to Tools > Options > LibreOffice Draw > Grid on the main menu bar to adjust the spacing (resolution) of the grid points. See Chapter 3 Working with Objects and Object Points for more information.

![Figure 21: Line dialog – Line page](image-url)
10) While you are working with a line (or any other element), use the information field on the Status bar to monitor your activity. A description of the current activity or selection is shown when you are working with elements and Figure 22 shows two examples.

**Arrows**

Arrows are drawn like lines because Draw classifies arrows as a subgroup of lines, that is lines with arrowheads. The information field on the status bar shows them only as lines. Click on the **Line Ends with Arrow** icon → to draw an arrow. The arrow head is drawn at the end point of the arrow when you release the mouse button.

![Arrows toolbar and available tools](image)
Different types of lines and arrows

Click on the small triangle to the right of the Lines and Arrows icon on the Drawing toolbar to open a pop-up toolbar with tools for drawing lines and arrows. Alternatively, go to View > Toolbars > Arrows on the main menu bar to open the Arrows toolbar as a floating toolbar. The Lines and Arrows icon on the Drawing toolbar always indicates the last tool used and may not be the same as the Lines and Arrows icon shown above. Figure 23 shows the tools that are available on the Arrows toolbar.

After drawing the line, you can change the arrow style by clicking on the Arrowheads icon in the Line and Filling toolbar and select the arrow start and end options. Start options are on the left and end options are on the right in Figure 24.

Rectangles or squares

Drawing a rectangle is similar to drawing a straight line. Click on the Rectangle icon in the Drawing toolbar. As you draw the rectangle with the mouse cursor, the rectangle appears with the bottom right corner of the rectangle attached to the cursor.

Squares are rectangles with all sides of equal length. To draw a square, click on the Rectangle icon and hold down the Shift key while you draw a square.

Note

If the option When creating or moving objects has been selected in Tools > Options > LibreOffice Draw > General, the action of the Shift key is reversed. When the Rectangle tool is selected, a square is drawn. To draw a rectangle you have to press the Shift key when drawing. This Shift key reversal also applies when drawing ellipses and circles in “Ellipses and circles” on page 29.

To draw a rectangle or square from its center rather than the bottom right corner, position your cursor on the drawing, press the mouse button and then hold down the Alt key while dragging with the cursor. The rectangle or square uses the start point where you first clicked the mouse button as the center.

With the rectangle or square selected, you can quickly change border style, line width, or color, and the type of fill color or fill pattern using the tools on the Line and Filling toolbar. For more
information on changing the attributes of a rectangle or square, see *Chapter 4 Changing Object Attributes*.

**Ellipses and circles**

To draw an ellipse (also called an oval), click on the **Ellipse** icon on the Drawing toolbar. A circle is an ellipse with both axes the same length. To draw a circle, click on the **Ellipse** icon and hold down the **Shift** key while you draw a circle.

To draw an ellipse or circle from its center, position your cursor on the drawing, press the mouse button and then hold down the **Alt** key while dragging with the cursor. The ellipse or circle uses the start point (where you first clicked the mouse button) as the center.

With the ellipse or circle selected, you can quickly change border style, line width, or color, and the type of fill color or fill pattern using the tools on the Line and Filling toolbar. For more information on changing the attributes of an ellipse or circle, see *Chapter 4 Changing Object Attributes*.

**Tip**

To quickly insert a line, rectangle, ellipse, or text, press and hold the **Ctrl** key down and then click on one of the icons for line, rectangle, ellipse, or text. An object is drawn automatically in the center of the workspace area using default values. The object attributes can then be changed using the Line Fill toolbar or the information in *Chapter 4 Changing Object Attributes*. This works only if the icon has no associated toolbar; that is, no triangle or arrow on the right side of the icon.

**Adding arc and segment tools to the Drawing toolbar**

If you regularly draw arcs or segments (partial circles or ellipses), then you can add the Circles and Ovals toolbar (Figure 25) to the Drawing toolbar. The Circles and Ovals toolbar is an optional toolbar and you have to customize the Drawing toolbar to add this optional toolbar.

*Figure 25: Circles and Ovals toolbar*

1) Go to **View > Toolbars > Customize** on the main menu bar, or right-click in a blank area in the Drawing toolbar and select **Customize Toolbar** from the context menu to open the Customize dialog (Figure 26).
2) Select the **Toolbars** tab to open the Toolbars page of the Customize dialog.
3) Select **Drawing** from the **Toolbar** drop down list and click **Add** to open the Add Commands dialog (Figure 27).
4) Select **Drawing** in the **Category** list.
5) Scroll down and select the first **Ellipse** command in the **Commands** list. Check the **Description** section at the bottom of the dialog as this will indicate that you have selected the command for the Circles and Ovals toolbar.
6) Click **Add** and then click **Close**.
7) In the Customize dialog, make sure the new **Ellipse** command is selected and checked.
8) For clarity, click **Modify > Rename** and type in **Circles and Ovals** as the new name for this command, then click **OK**.
9) Use the up and down arrow buttons to move the new **Circles and Ovals** command to the desired position on the Drawing toolbar.
10) Click **OK** to save the customized Drawing toolbar and close the Customize dialog.
Figure 26: Customize dialog

Figure 27: Add Commands dialog
The icon used to open the Circles and Ovals toolbar is still called Ellipse and is not to be confused with the Ellipse icon that is one of the default tools placed on the left of the Drawing toolbar.

The new Circles and Ovals (Ellipse) icon appears on the Drawing toolbar with a small triangle to the right of it. Click on this triangle to open the Circles and Ovals toolbar (Figure 25). To make this toolbar into a floating toolbar, drag the toolbar onto the workspace area. The Circles and Ovals icon on the Drawing toolbar always indicates the last tool used and may not be the same as the Circles and Ovals icon shown above.

To help prevent any confusion, you can remove the standard Ellipse icon from the Drawing toolbar by opening the Customize dialog (Figure 26) and deseleting the first Ellipse command in the Commands list. Alternatively, select the first Ellipse command, click Modify and select Delete from the context menu.

To return the Drawing toolbar to its default settings, open the Customize dialog, click Restore and then Yes to reset the Drawing toolbar to the default settings.

Arcs or segments

1) To draw an arc or segment, select the appropriate icon in the Circles and Ovals toolbar (Figure 25).
2) Click and drag with the cursor to create a guide circle or ellipse.
3) Move the cursor to the position where you want the arc or segment to start. The status bar indicates the angle in degrees.
4) Click to start drawing the arc or segment.
5) Move the cursor to create the arc or segment. The status bar shows the angle in degrees.
6) When you have drawn the arc or segment you require, click again to complete the arc or segment.

Curves or polygons

To draw a curve or polygon, click the Curve icon on the Drawing toolbar. Click on the triangle to the right of the icon to open the toolbar (Figure 28). The Curve icon on the Drawing toolbar always indicates the last tool used and may not be the same as the Curve icon shown above. Hovering the cursor over this icon gives a tooltip of Curve. If you open the floating toolbar, the toolbar title is Lines.
**Curves**

1) Click and hold the left mouse button to create the starting point of your curve, then drag from the starting point to draw a line.
2) Release the left mouse button and continue to drag the cursor to bend the line into a curve.
3) Click to set the end point of the curve and fix the curve on the page. Only the first section of your curve is drawn as a curve.
4) To continue with your curve, click and drag the cursor to draw a straight line. Each mouse click sets a corner point and allows you to continue drawing another straight line from the last corner point.
5) Double-click to end the drawing of your curve.

If you selected a filled curve, the last point is automatically joined to the first point to close off the curve and fills it with the current standard fill color. A curve without filling will not be closed when you end the drawing.

**Polygons**

1) Click and draw the first line from the start point while holding the left mouse button held down.
2) Release the mouse button when you have reached the second point of your polygon and a line between the first and second points is drawn.
3) Move the cursor to where you want the next point point in your polygon and click the mouse button to draw the next line.
4) Double-click to end the drawing of your polygon.

If you selected a filled polygon, the last point is automatically joined to the first point to close off the polygon and fills it with the current standard fill color. A polygon without filling will not be closed when you end the drawing.

**Polygons 45°**

These polygons are drawn the same way as ordinary polygons above, but the angles between lines are restricted to 45 or 90 degrees when you create another point in your polygon.

| Note | Holding down the Shift key when drawing lines with the Curve or Polygon tools will also restrict the angles between the lines to 45 or 90 degrees. |

**Freeform lines**

Using the Freeform Line tools is similar to drawing with a pencil on paper.

1) Click and drag the cursor to the line shape you require.
2) Release the mouse button when you are satisfied with your freeform line and the drawing is completed.

If you selected a filled freeform line, the last point is automatically joined to the first point to close off the freeform line and fills it with the current standard fill color. A freeform line without filling will not be closed when you end the drawing.
**Gluepoints and connectors**

**Gluepoints**

All Draw objects have glue points, which normally are not displayed. Gluepoints become visible when the **Connectors** icon on the Drawing toolbar is selected.

Most objects have four gluepoints (Figure 29). You can add more glue points and customize glue points using the **Gluepoints** toolbar (Figure 30). Go to **View > Toolbars > Gluepoints** on the main menu bar to open the toolbar.

Gluepoints are not the same as the selection handles of an object. The handles are for moving or changing the shape of an object, as described in Chapter 3 Working with Objects and Object Points.

Gluepoints are used to fix or glue a connector to an object so that when the object moves, the connector stays fixed to the object. For a more detailed description on the use of gluepoints, see Chapter 8 Connections, Flowcharts and Organization Charts.

![Figure 29: Gluepoints](image)

**Connectors**

Connectors are lines or arrows whose ends automatically snap to a gluepoint of an object. Connectors are useful in drawing organization charts, flow diagrams, and mind-maps. When objects are moved or reordered, the connectors remain attached to a gluepoint. Figure 31 shows an example of two objects and a connector.

Draw offers a range of different connectors and connector functions. Click on the triangle to the right of the **Connector** icon to open the Connectors toolbar (Figure 32). The **Connector** icon on the Drawing toolbar always indicates the last tool used and may not be the same as the **Connector** icon shown above.

For a more detailed description of the use of connectors, see Chapter 8 Connections, Flowcharts and Organization Charts.
Drawing geometric shapes

The icons for drawing geometric shapes are located on the Drawing toolbar and each geometric shape is explained in the following sections. Clicking on the triangle to the right of the icon opens a floating toolbar giving access to the tools for that geometric shape.

The use of these tools for geometric shapes is similar to the tool used for drawing rectangles and squares. For more information, see “Rectangles or squares” on page 28.

The icons used on the Drawing toolbar for drawing geometric shapes always indicates the last tool used and may not be the same as the icons shown in the following sections.

Basic shapes

Click on the triangle to the right of the Basic Shapes icon to open the Basic Shapes toolbar (Figure 33) for drawing basic shapes. This toolbar also includes a rectangle tool identical to the one already displayed on the Drawing toolbar.
**Symbol shapes**

Click on the triangle to the right of the **Symbol Shapes** icon 🌟 to open the Symbol Shapes toolbar for drawing symbols.

![Symbol Shapes toolbar](image)

**Figure 34: Symbol Shapes toolbar**

**Block arrows**

Click on the triangle to the right of the **Block Arrows** icon 📈 to open the Block Arrows toolbar for drawing block arrows.

![Block Arrows toolbar](image)

**Figure 35: Block Arrows toolbar**

**Flowcharts**

Click on the triangle to the right of the **Flowcharts** icon 📅 to open the Flowchart toolbar for symbols used in drawing flowcharts. The creation of flowcharts, organization charts, and similar planning tools are further described in *Chapter 8 Connections, Flowcharts and Organization Charts.*

![Flowcharts toolbar](image)

**Figure 36: Flowcharts toolbar**

**Callouts**

Click on the triangle to the right of the **Callouts** icon 📚 to open the Callouts toolbar for drawing callouts.

![Callouts toolbar](image)

**Figure 37: Callouts toolbar**
Stars and banners

Click on the triangle to the right of the Stars icon to open the Stars and Banners toolbar for drawing stars and banners.

Figure 38: Stars and Banners toolbar

Adding text to drawings and objects

In Draw you can add, insert, and format text to a drawing, objects, and shapes as follows:

• As a dynamic text frame, which is an independent Draw object and expands as you add more text within the frame.

• Text within a previously drawn object. This integrates text within the object and is placed within the boundary rectangle that surrounds an object. This boundary rectangle is not dynamic and care must be taken so that your text does not go outside of the object boundaries.

For more information on how to add, insert, and format text in a drawing or drawing objects, see Chapter 9 Adding and Formatting Text.
Chapter 3
Working with Objects and Object Points
Introduction

This chapter looks at the tools and functions that let you modify existing drawings. All of the functions apply to a selected object or a group of selected objects, which can be distinguished by selection handles on a rectangular frame that is large enough to contain the object. Where several objects are selected, the frame around the objects corresponds to the smallest rectangle that can contain all of the objects. This frame is called the selection rectangle.

Note

The color and shape of the selection handles will change depending on the tool and function that has been selected to change the object properties. The color of the selection handles also depends on the computer operating system and how the computer has been set up.

Selecting objects

Direct selection

The easiest way to select an object is to click directly on it. For objects that are not filled, click on the object outline to select it. One click selects; a second click deselects. To select or deselect more than one object, hold the Shift key down while clicking.

Selection by framing

You can also select several objects at once by dragging the mouse cursor around the objects. This draws a rectangle around the objects, and only objects that lie entirely within the rectangle will be selected.

To select multiple objects by framing, the Select icon on the Drawing toolbar must be active.

Note

When you drag the mouse cursor to select multiple objects, the selection rectangle being drawn is also known as a marquee.

Selecting hidden objects

If objects are located behind others and not visible, they can still be selected.

• For computers using a Windows or Mac operating system.
  Select the object in front of the hidden objects, then press the Alt key and click to select the hidden object. If there are several hidden objects, keep holding down the Alt key and clicking until you reach the object you want. To cycle through the objects in reverse order, hold down the Alt+Shift keys and click.

• For computers using a Linux operating system.
  Press the Tab key to cycle selection through the objects in your drawing, stopping at the hidden object you want to select. To cycle through the objects in reverse order, press Shift+Tab. This is a very quick way to reach an object, but it may not be practical if there a large number of objects in a drawing.

When you select a hidden object, its selection handles will appear through the objects covering it.
Arranging objects

In a complex drawing, several objects may be stacked on top of one another. To rearrange the stacking order by moving an object forward or backward using one of the following methods:

- Select an object, go to Modify > Arrange on the main menu bar, or right-click on the object and select Arrange, then select one of the following:
  - Bring to Front
  - Bring Forward
  - Send Backward
  - Send to Back
  - In Front of Object
  - Behind Object

- Select an object, then use one of the following keyboard shortcuts:
  - Ctrl+Shift++ (bring to front)
  - Ctrl++ (bring forward)
  - Ctrl+- (send backward)
  - Ctrl+Shift+- (send to back)

- Select an object, then click on the small triangle to the right of the Arrange icon on the Line and Filling toolbar to open the Position toolbar, giving access to the arrangement options as shown in Figure 39.

Positioning and adjusting objects

Using zoom

To help in the positioning and adjustment of objects, Draw has a zoom function that reduces or enlarges the screen display of the current drawing. For example, zoom in to place objects onto your drawing with greater position; zoom out to see the complete drawing. You can control zooming three ways: from the Status bar, Zoom dialog, or Zoom toolbar.

Note: Zooming is handled differently on Linux and Windows operating systems. A document saved with a 100% zoom factor in Windows is displayed at a larger zoom factor in Linux.
Status bar
The zoom controls are located on the right side of the status bar (Figure 40); these controls give you quick and easy access to zooming.

Figure 40: Status bar zoom controls

- Click on the minus sign to reduce the zoom factor.
- Click on the plus sign to increase the zoom factor.
- Click and hold on the slide control and move it to increase or decrease the zoom factor.
- Right-click on the zoom percentage number and select a zoom factor from the context menu that opens.
- Double-click on the zoom percentage number and select a zoom factor from the Zoom & View Layout dialog (Figure 41) that opens.

Figure 41: Zoom & View Layout dialog

Zoom layout dialog
Go to View > Zoom > Zoom on the main menu bar or double-click on the zoom percentage figure on the Status bar (Figure 40) to open the Zoom & View Layout dialog (Figure 41), where you can increase or reduce the zoom factor. The current zoom percentage is displayed on the Status bar.

Zoom factor
Sets the zoom factor at which to display the current document and all documents of the same type that you open thereafter.

- **Optimal** – resizes the display to fit the width of the text in the document.
- **Fit width and height** – displays the entire page on your screen.
- **Fit width** – displays the complete width of the document page. The top and bottom edges of the page may not be visible.
- **100%** – displays the document at its actual size.
- **Variable** – enter a percentage in the box for the zoom factor at which you want to display the document.
**Zoom toolbar**

Go to View > Toolbars > Zoom to open the Zoom toolbar (Figure 42) and the tools on this toolbar are as follows:

- **Zoom In** – displays the slide at two times its current size. Click once on the tool, then move the cursor onto the object and click again. You can also select the **Zoom In** tool and drag a rectangular frame around the area you want to enlarge.
- **Zoom Out** – displays the drawing at half its current size each time the tool is clicked.
- **Zoom 100%** – displays the drawing at its actual size.
- **Zoom Previous** – returns the display of the drawing to the previous zoom factor you applied. You can also use the keyboard shortcut Ctrl + , (Comma).
- **Zoom Next** – undoes the action of the Previous Zoom command. You can also use the keyboard shortcut Ctrl + . (Period).
- **Zoom Page** – displays the whole drawing on your screen.
- **Zoom Page Width** – displays the complete width of the drawing. The top and bottom edges of the slide may not be visible.
- **Optimal** – resizes the display to include all of the objects on the slide.
- **Object Zoom** – resizes the display to fit the object(s) you selected.
- **Shift** – moves the drawing within the Draw workspace. Place the cursor on the drawing and drag to move the drawing. When you release the cursor, the last tool you used is automatically selected.

**Moving and adjusting object size**

When moving an object or changing its size, check the left-hand area of the status bar at the bottom of the Draw window (Figure 43). From left to right, this area shows what object is selected, its position on the drawing in X/Y coordinates and dimensions of the object. The units of measurement are those selected in Tools > Options > LibreOffice Draw > General.
Moving objects
To move an object (or a group of objects), select it and then click within the object borders and hold down the left mouse button while dragging the mouse. During movement, a ghost image of the object appears to help with repositioning. When the object reaches its new location, release the mouse button.

Adjusting object size
To change the size of a selected object (or a group of selected objects), move the cursor to one of the selection handles. The cursor will change shape to indicate the direction of movement for that selection handle. As you change the size of the object, a ghosted image of the object appears. When you have reached the desired size of the object, release the mouse button.

The results depend on which selection handle you use. To resize an object along one axis, use a selection handle on one of the sides. To resize along both axes, use a corner selection handle.

Note
If you press the Shift key while resizing an object, the change in size will be carried out symmetrically with respect to the two axes so that the aspect ratio of the object remains the same. This Shift key behavior works on all selection handles. This is the default behavior of the Shift key. However, if When creating or moving objects has been selected in Tools > Options > LibreOffice Draw > Grid, the action of the Shift key is reversed: that is the aspect ratio will be preserved unless the Shift key is pressed.

Modifying arcs
The size of an arc can be changed by adjusting the positions of the start and end points of an arc.
Select an arc and click on the Points icon on the Drawing toolbar. Two larger handles appear at the start and end of the arc (Figure 44). When the cursor hovers over one of these larger handles, the cursor changes shape, allowing you to adjust the position of either the start or end points of the arc.

Figure 44: Modifying arcs
Rotating and slanting objects

Rotating objects

To rotate an object (or a group of objects), select the object, then go to rotation mode using one of the following methods:

- Click on the **Rotate** icon on the Line and Filling toolbar.
- Go to **View > Toolbars > Mode** on the main menu bar and select the **Rotate** icon on the Mode toolbar.

The selection handles will change shape and color (Figure 45). Also a center of rotation indicator will appear in the center of the object. As you move the cursor over the handles, the cursor changes shape. The corner handles are for rotating the object, and the top, bottom and side handles are to shear or slant the object.

![Figure 45: Rotating objects](image)

Move the cursor to one of the corner handles, then click and hold the mouse button and start to move the cursor to rotate the object. A ghosted outline of the object being rotated appears and the current angle of rotation is shown in the status bar.

**Note**

Rotation works in a slightly different way for 3D objects because it occurs in a three dimensional space and not in a single plane. See Chapter 7 Working with 3D Objects for more information.

The rotation center is normally located at the center of an object. To change the position of the rotation center, click on the rotation center and drag until it is at the desired position. This rotation center can even be outside of the object.

**Note**

If you press the *Shift* key while rotating an object, rotation will be restricted to 15° of movement.

This is the default behavior of the *Shift* key. However, if *When creating or moving objects* has been selected in **Tools > Options > LibreOffice Draw > Grid**, the action of the *Shift* key is reversed: that is rotation will be restricted to 15° of movement unless the *Shift* key is pressed.

Slanting objects

To slant an object, click on the **Rotate** icon, then use the handles located at the midpoints on the top, bottom and sides of a selected object. The cursor changes shape when it hovers over one of these midpoint handles indicating the direction of slanting. The axis used for slanting an object is the object edge directly opposite the midpoint handle being used to slant the object. This axis stays...
fixed in location while the other sides of the object move in relation to it as you drag the mouse cursor. Figure 46 shows a rectangle slanted using the selection handle at the top of the object.

Click and hold the mouse button, then start to move the cursor to slant the object. A ghosted outline of the object being slanted appears and the current angle of slanting is shown in the status bar.

Figure 46: Slanting objects

| Note | If you press the *Shift* key while slanting an object, slanting will be restricted to 15° of movement.

This is the default behavior of the *Shift* key. However, if "When creating or moving objects" has been selected in Tools > Options > LibreOffice Draw > Grid, the action of the *Shift* key is reversed: that is slanting will be restricted to 15° of movement unless the *Shift* key is pressed.

Setting exact size and position

You can position and resize objects with the mouse, but this method is not exact. If you want to accurately position and size an object, go to Format > Position and Size on the main menu bar, or right-click on an object and select Position and Size from the context menu, or press the F4 key to open the Position and Size dialog (Figure 47).

**Position and Size**

Open the Position and Size dialog and click on the Position and Size tab (Figure 47) to set the appropriate values.

Figure 47: Position and Size dialog
• **Position** – specify the location of the selected object on the page.
  - *Position X* – enter the horizontal distance that you want to move the object relative to the base point selected in the grid.
  - *Position Y* – enter the vertical distance that you want to move the object relative to the base point selected in the grid.
  - *Base point* – select a base point in the grid and then enter the amount that you want to shift the object relative to the base point that you selected in the Position Y and Position X boxes. The base points correspond to the selection handles on an object.

• **Size** – specify the amount by which you want to resize the selected object with respect to the selected base point.
  - *Width* – enter a width for the selected object.
  - *Height* – enter a height for the selected object.
  - *Keep ratio* – maintains proportions when you resize the selected object.
  - *Base point* – select a base point in the grid, and then enter the new size dimensions for the selected object in the Width and Height boxes.

• **Protect**
  - *Position* – prevents changes to the position or the size of the selected object.
  - *Size* – prevents you from resizing the object.

• **Adapt** – specifies, if the size of a drawing object should be adjusted to fit the size of entered text.
  - *Fit width to text* – expands the width of the object to the width of the text, if the object is smaller than the text.
  - *Fit height to text* – expands the height of the object to the height of the text, if the object is smaller than the text.

The units of measurement used for X/Y coordinates and the width and height of the object are set by going to **Tools > Options > LibreOffice Draw > General**.

The default location of the base points for position and size is the upper left corner of the drawing area. You can temporarily change this base point to make positioning or dimensioning simpler by clicking on a position corresponding to the location of the base point you want to use. This change in base point is only valid for single use and the base point is reset to the standard position of top left corner when you close the Position and Size dialog.

**Rotating objects**

To accurately rotate an object, click on the **Rotation** tab of the Position and Size dialog (Figure 48). Use this dialog to define the rotation angle and the location of the pivot point.

• **Pivot point** – the selected object is rotated around a pivot point that you specify. The default pivot point is at the center of the object. If you set a pivot point too far outside of the object boundaries, the object could be rotated off of the page.
  - *Position X* – enter the horizontal distance from the left edge of the page to the pivot point.
  - *Position Y* – enter the vertical distance from the top edge of the page to the pivot point.
  - *Default settings* – select where you want to place the pivot point. Default position is the center of the object. Changing the rotation pivot point is only valid for single use. The pivot point is reset to default settings when you close the Position and Size dialog.
Figure 48: Rotating objects

- **Rotation angle** – specify the number of degrees that you want to rotate the selected object, or click in the rotation grid.
  - *Angle* – enter the number of degrees that you want to rotate the selected object.
  - *Default settings* – click on the indicator to rotate the object. The number of degrees is shown in the *Angle* box as you rotate the indicator.

**Slant and corner radius**

To accurately set the corner radius or slant angle of an object, click on the *Slant & Corner Radius* tab of the Position and Size dialog (Figure 49).

- **Corner Radius** – you can only round the corners of a rectangular object. If this section is grayed out, then you cannot set a corner radius.
  - *Radius* – enter the radius of the circle that you want to use to round the corners. The larger the value for corner radius set, the rounder the corners of an object become.

- **Slant** – slants the selected object along the bottom edge of the object.
  - *Angle* – enter the angle of the slant axis. The slant angle relates to how much an object inclines or slants from its normal vertical position on a drawing.
Using grid and snap functions

In Draw, you can also position objects accurately and consistently using grid points, snap points and lines, object frames, individual points on objects, or page edges. This function is known as **Snap**.

It is easier to use snap functions at the highest practical zoom value for your drawing. You can use two different snap functions at the same time; for example, snapping to a guide line and the page edge. However, it is recommended to activate only those snap functions that you really need.

Configuring grid and snap functions

To configure the grid and snap functions in your drawing, go to **Tools > Options > LibreOffice Draw > Grid** to display the Grid dialog (Figure 50). The grid and snap functions can also be displayed and switched on or off using this dialog, right-clicking on your drawing and using the options in the context menu, or using the icons in the Options toolbar (Figure 51). If the Options toolbar is not open, go to **View > Toolbars > Options**.

![Figure 50: LibreOffice Draw Grid dialog](image)

![Figure 51: Options toolbar](image)

- **Grid** – specifies the settings for the configurable grid on your document pages. This grid helps you determine the exact position of your objects. You can also set this grid in line with the magnetic snap grid. If you have activated the snap grid but wish to move or create individual objects without snap positions, keep the **Shift** key pressed to deactivate this function for as long as needed.
  - **Snap to grid** – specifies whether to move frames, drawing elements, and controls only between grid points. To change the status of the snap grip only for the current action, drag an object while holding down the **Ctrl** key.
  - **Visible grid** – specifies whether to display the grid.

Chapter 3  Working with Objects and Object Points  47
• Resolution
  – **Horizontal** – defines the unit of measure for the spacing between grid points on the X-axis.
  – **Vertical** – defines the grid points spacing in the desired unit of measurement on the Y-axis.

• Subdivision
  – **Horizontal** – specify the number of intermediate spaces between grid points on the X-axis.
  – **Vertical** – specify the number of intermediate spaces between grid points on the Y-axis.

• Synchronize axes – specifies whether to change the current grid settings symmetrically. The resolution and subdivision for the X and Y axes remain the same.

• Snap
  – **To snap lines** – snaps the edge of a dragged object to the nearest snap line when you release the mouse button. You can also define this setting by using the **Snap to Snap Lines** icon on the Options toolbar.
  – **To the page margins** – specifies whether to align the contour of the graphic object to the nearest page margin. The cursor or a contour line of the graphics object must be in the snap range. In a drawing, this function can also be accessed with the **Snap to Page Margins** icon in the Options toolbar.
  – **To object frame** – specifies whether to align the contour of the graphic object to the border of the nearest graphic object. The cursor or a contour line of the graphics object must be in the snap range. In drawing, this function can also be accessed with the **Snap to Object Border** icon in the Options toolbar.
  – **To object points** – specifies whether to align the contour of the graphic object to the points of the nearest graphic object. This only applies if the cursor or a contour line of the graphics object is in the snap range. In a drawing, this function can also be accessed with the **Snap to Object Points** icon in the Options toolbar.
  – **Snap range** – defines the snap distance between the mouse pointer and the object contour. Snaps to a snap point if the mouse pointer is closer than the distance selected.

• Snap position
  – **When creating or moving objects** – specifies that graphic objects are restricted vertically, horizontally or diagonally (45°) when creating or moving them. You can temporarily deactivate this setting by pressing the **Shift** key.
  – **Extend edges** – specifies that a square is created based on the longer side of a rectangle when the **Shift** key is pressed before you release the mouse button. This also applies to an ellipse (a circle will be created based on the longest diameter of the ellipse). When **Extend edges** is not selected, a square or a circle will be created based on the shorter side or diameter.
  – **When rotating** – specifies that graphic objects can only be rotated within the rotation angle that you selected. If you want to rotate an object outside the defined angle, press the **Shift** key when rotating. Release the key when the desired rotation angle is reached.
  – **Point reduction** – defines the angle for point reduction. When working with polygons, you might find it useful to reduce their editing points.
Snap to grid

Using Snap to Grid
Use the Snap to Grid function to move an object exactly onto a grid point in your drawing. This function can be switched on and off using one of three methods:

1) Go to View > Grid > Snap to Grid.
2) Right-click on your drawing and selecting Snap to Grid from the context menu.
3) Click on the Snap to Grid icon on the Options toolbar.

Displaying grid
Displaying or turning off the grid in your drawing can be done using one of four methods:

1) Go to View > Grid > Display Grid.
2) Click on the Display Grid icon on the Options toolbar.
3) Right-click on your drawing and select Display Grid from the context menu.
4) Selecting Visible grid option in the Grid dialog (Figure 50 on page 47).

Changing color of grid points
By default the grid points are gray and, depending on you display and computer setup, are not always easy to see. To change the color of the grid points, go to Tools > Options > LibreOffice > Appearance to open the Appearance dialog (Figure 52). In the Drawing/Presentation section, select a more suitable color from the drop-down list.

![LibreOffice Appearance dialog](image)

Figure 52: LibreOffice Appearance dialog

Snap points and lines
Unlike the grid, snap lines and snap points are inserted by you when you want to position an object in a specific position on your drawing. Snap lines can either be horizontally or vertically and appear
as dashed lines. Snap points appear as small crosses with dashed lines. Snap points and snap lines do not appear in printed output.

**Inserting snap points and snap lines**

To insert a snap point or snap line, go to **Insert > Insert Snap Point/Line** or right-click on your drawing and select **Insert Snap Point/Line** from the context menu to open the New Snap Object dialog (Figure 53).

![New Snap Object dialog](image)

**Figure 53: New Snap Object dialog**

- **Position** – sets the position of a selected snap point or line relative to the top left corner of the page.
  - *X axis* – enter the amount of space you want between the snap point or line and the left edge of the page.
  - *Y axis* – enter the amount of space you want between the snap point or line and the top edge of the page.
- **Type** – specifies the type of snap object you want to insert.
  - *Point* – inserts a snap point.
  - *Vertical* – inserts a vertical snap line.
  - *Horizontal* – inserts a horizontal snap line.

**Inserting snap lines using rulers**

Snap lines, but not snap points, can be inserted using the vertical or horizontal rulers. If the rulers are not displayed, go to **Tools > Options > LibreOffice Draw > View** and select **Rulers visible**.

To insert a snap line, move the cursor to a ruler, then click and drag a snap line to the required position.

**Displaying snap points and lines**

Displaying or turning off snap points and lines in your drawing can be done using one of these methods:

- Go to **View > Grid > Display Snap Lines** on the main menu bar.
- Click on the **Display Snap Lines** icon on the Options toolbar.
- Right-click on your drawing and select **Display Snap Lines** from the context menu.
**Editing snap points and lines**

To edit a snap point, right-click on the snap point and select **Edit Snap Point** from the context menu to open the New Snap Object dialog or drag it to a new position on your drawing.

To edit a snap line, right-click on the snap line and select **Edit Snap Line** from the context menu to open the New Snap Object dialog or drag the snap line to a new position on your drawing.

**Deleting snap points and lines**

To delete a snap point, drag it back to a ruler or right-click on the snap point and select **Delete Snap Point** from the context menu.

To delete a snap line, drag it back to the ruler or right-click on the snap line and select **Delete Snap Line** from the context menu.

**Configuring snap range**

To configure the snap range of when an object snaps to position, go to **Tools > Options > LibreOffice Draw > Grid** (Figure 50 on page 47) and enter the number of pixels to set the proximity of when the object will snap into position in the **Snap range** box. The default setting is 5 pixels.

**Using guide lines**

Guide lines (also known as help lines) are another function in Draw to help you position objects. Guide lines can be displayed while the object is being moved. They extend from the edges of the object to the rulers at the top and left side of your drawing and do not have a snap function (Figure 54).

To use guide lines, go to **Tools > Options > LibreOffice Draw > View** and select the **Snap Lines when moving** option or click the **Helplines While Moving** icon on the Options toolbar.

![Figure 54: Using guide lines](image)

**Changing form of regular shapes**

When drawing certain regular shapes, one or more dots are displayed in a different color to the selection handles when an object is selected. When the cursor hovers over one of these dots, it changes shape. Clicking and dragging on one of these dots modifies the shape of the object. For example, you can increase the corner radius of a rounded rectangle or square, change the angles of an arc, and so on.
These dots perform different functions according to the shape selected. These functions are listed in the following sections.

**Basic shapes**
- Rounded rectangles and squares – use the dot to change the radius of the curve that replaces the angled corners of a rectangle or square.
- Circle pie – use the dots to change the size of the filled sector.
- Isosceles triangle – use the dot to modify the triangle type.
- Trapezoid, parallelogram, hexagon, or octagon – use the dot to change the angle between the sides.
- Cross – use the dot to change the thickness of the four arms of the cross.
- Ring – use the dot to change the internal diameter of the ring.
- Block arc – use the dot to change both internal diameter and size of the filled area.
- Cylinder and cube – use the dot to change the perspective.
- Folded corner – use the dot to change the size of the folded corner.
- Frame – use the dot to change the thickness of the frame.

**Symbol shapes**
- Smiley face – use the dot to change the smile on the face.
- Sun, moon, heart – use the dot to change the shape of the symbol.
- Prohibited symbol – use the dot to change the thickness of the ring and the diagonal bar.
- Double bracket, left bracket, right bracket, double brace – use the dot to change the curvature of the bracket.
- Left brace, right brace – use the dots to change the curvature of the brace and the position of the point.
- Square bevel, octagon bevel, diamond bevel – use the dot to change the thickness of the bevel.

**Block arrows**
- Arrows – use the dot to change the shape and thickness of the arrows.
- Pentagon, chevron – use the dot to change the angle between the sides.
- Arrow callouts – use the dots to change the shape and thickness of the callouts.
- Circular arrow – use the dots to change the thickness and area of the arrow.

**Callouts**
- Callouts – use the dots to change the length, position and angle of the pointer.

**Stars**
- 4-point star, 8-point star, 24-point star – use the dot to change the thickness and shape of the star points.
- Vertical scroll, horizontal scroll – use the dot to change the width and shape of the scroll.
- Doorplate – use the dot to change the inward curvature of the corners.
Curves and polygons

Bézier curves

The editing of curves depends on the mathematics of Bézier curves\(^1\). Explaining Bézier curves goes beyond this scope of this chapter. See Chapter 9 Advanced Draw Techniques for more information on drawing and manipulating Bézier curves.

The editing of a Bézier curve consists in principle of moving points or tangents passing through these points. Each tangent has one control point at each end and a junction point where it meets the curve. The relative angle and distance between the control points determine the shape of the curve. Figure 55 shows what happens starting from a basic circle and changing only one point on the circle.

You can create many different shapes by moving either the junction point itself, or one or both of the round handle points at either end of the tangent. Draw offers more possibilities when you use the functions on the Edit Points toolbar.

![Figure 55: Creating different shapes by changing the tangent](image)

Converting to curve or polygon

Before modifying the points on an object, you must convert the object to a curve or a polygon, depending on what kind of effect you want to produce.

After selecting an object, go to Modify > Convert on the main menu bar and select either To Curve or To Polygon. Alternatively, right-click on an object and select Convert > To Curve or Convert > To Polygon from the context menu.

After converting an object to a curve or polygon, click on the Points icon on the Drawing toolbar and the Edit Points toolbar opens (Figure 56). You can also open this toolbar using View > Toolbars > Edit Points on the main menu bar.

You will notice that after the conversion, the handles located in the corners of the selection rectangle have disappeared. This behavior is normal because the handles used with the tools on the Edit Points toolbar are located along the outline or trace of the object.

Edit Points toolbar

Open the Edit Points toolbar (Figure 56) by going to View > Toolbars > Edit Points on the main menu bar. It will then appear whenever you select an object that is a curve or polygon and the Points icon on the Drawing toolbar. Available tools on the Edit Points toolbar will depend on the object selected and which object point has been selected.

---

\(^1\) Bézier curves were invented by Pierre Bézier, an engineer working with the Renault car manufacturer, who developed the technique in the 1960s. The technology was intended to make modeling the surface of vehicles easier.
Tangents

Before you can use tangents on an object, you must convert the object to a curve. Go to Modify > Convert > To Curve on the main menu bar or right-click on the object and select Convert > To Curve from the context menu.

Note

Tangents are only used on curves. If an object has been converted to a polygon and a tangent is added, the object is automatically converted to a curve.

Symmetric transition

Symmetric Transition converts a corner point or a smooth point into a symmetrical point. Both control points of the corner point are aligned in parallel and have the same length. They can only be moved simultaneously and the degree of curvature is the same in both directions.

1) Convert the object to a curve and click on the selection handle where you want to place the tangent.

2) Click on the Symmetric Transition icon.

3) Click and drag one of the tangent handles to change the shape of the object. Any movement of one tangent handle is carried over symmetrically to the other handle, as shown in Figure 57.

Figure 57: Symmetric transition
Smooth transition

Smooth Transition converts a corner point or symmetrical point into a smooth point. Both control points of the corner point are aligned in parallel, and can only be moved simultaneously. The control points may differentiate in length, allowing you to vary the degree of curvature.

1) Convert the object to a curve and click on the selection handle where you want to place the tangent.

2) Click on the Smooth Transition icon so you can adjust separately the lengths on each side of a tangent to make a curve flatter or steeper.

3) Click and drag one of the tangent handles to change the shape of the object. This creates an asymmetric tangent; the curve is flatter on the longest side of the tangent (Figure 58).

![Figure 58: Smooth transition](image)

Corner point

Use Corner Point to convert the selected point or points into corner points. Corner points have two movable control points, which are independent from each other. A curved line, therefore, does not go straight through a corner point, but forms a corner.

It is possible to change independently the angle on each side of a tangent using the central point of the tangent as a corner point.

1) Convert the object to a curve and click on the selection handle where you want to place the corner point.

2) Click on the Corner Point icon to create a corner point at the selected point (Figure 59).

3) Click and drag the end of one of the tangents to change its angle. Each tangent can be moved independently to create spikes and troughs in curves.

![Figure 59: Corner point](image)
**Tangent rotation**

You can alter the angle by which a tangent relates to curve by clicking on one of the end points of the tangent and rotating it with the cursor. As you change the angle of the tangent, the shape of the curve changes in response (Figure 60).

![Figure 60: Tangent rotation](image)

**Points**

**Moving points**

**Move Points** activates a mode in which you can move points. The cursor displays a small empty square when resting on a point. Drag that point to another location. The curve on both sides of the point follows the movement; the section of the curve between the next points changes shape.

Point at the curve between two points or within a closed curve and drag the mouse to shift the entire curve without distorting the form.

1) Make sure the object is converted to a curve.

2) Click on the **Move Points** icon to move any of the points when an object has been converted to a curve or polygon.

3) Hover over a point until the cursor changes shape, then drag the point to create a new shape. Figure 61 illustrates how an ovoid or egg shape was created from a circle by dragging the right hand side point to the right.

![Figure 61: Moving points](image)

**Inserting points**

**Insert Points** activates a mode in which you can insert points. You can also move points in this mode, just as in the move mode. If, however, you click on the curve between two points and move the cursor a little while holding down the mouse button, you insert a new point. The point is a smooth point and the lines to the control points are parallel and remain so when moved.

If you wish to create a corner point, you must first insert either a smooth or a symmetrical point which is then converted to a corner point by using Corner Point.

1) Make sure the object is converted to a curve.
2) Click on the **Insert Points** icon to add an extra point to an existing curve or polygon.

3) Click on the object border at the spot where you want to insert a point. The tangent type associated with the new point depends on where the point has been added to the object border. Figure 62 shows a new point added to the top right of an ovoid shape.

![Figure 62: Inserting points](image)

**Deleting points**

Select a point on the border of the object, then use the **Delete Points** icon to delete one or more selected points from the border of the object. To select several points, click on those points while holding down the **Shift** key. The resulting curve automatically changes shape around the remaining points. You can also delete selected points by pressing the **Del** key on the keyboard.

Figure 63 shows what happens when the right point was deleted from a circle. The left image is a curve with the right point deleted. The right image is a curve where points have been converted to a line (see “Converting curves or lines” on page 58) and the right point has been deleted. This forms a straight line is formed between the two points on either side of the deleted point.

![Figure 63: Deleting points](image)

**Eliminating points**

The **Eliminate Points** icon only functions on lines with multiple points. These lines are created when a curve is converted to a line using the **Convert to Curve** icon on the Edit Points toolbar (see “Converting curves or lines” on page 58). The process of eliminating points from a line to create a straight line is shown in Figure 64.

1) Select a line with multiple points where the points have been converted to a line.

2) Click on the **Points** icon on the Drawing toolbar. The Edit Points toolbar should open. If it does not open, then go to **View > Toolbars > Edit Points** on the main menu bar to open it.

3) Use the mouse cursor to select the point on the line that you want to eliminate. The selected point will be emphasized.
4) Make sure the **Eliminate Points** icon is active. The area around the icon becomes shaded when active. If it is not active, click on the Eliminate Points icon.

5) Accurately position the mouse cursor over the selected point, then click and start dragging the selected point. As you drag, a dotted line forms between the two neighboring points.

6) When this dotted line appears to be a straight line between the two neighboring points, release the mouse button. The selected point is eliminated and a straight line now exists between the two neighboring points.

**Converting curves or lines**

Curves and lines can be easily converted to each other using the **Convert to Curve** icon on the Edit Points toolbar. When a curve is converted to a line, a straight line is created between selected points on a curve. When a line is converted to a curve, a curve is created between selected points on a line.

1) Select a curve or line and then select the points on the curve or line where you want to do the conversion.

2) Click on the **Convert to Curve** icon and a curve is converted into a line or a line is converted into a curve (Figure 65).
Figure 65: Converting curves and lines

Splitting curves

1) Select a point on the curve.

2) Click on the **Split Curve** icon 🛠️ to split or cut a curve at the location of the selected point. If the object is filled, it will be emptied because the curve that represented the object border is no longer closed (Figure 66).

3) To separate a curve at several points simultaneously, keep the **Shift** key pressed down and select all of the points at which the cut should occur, then click on the **Split Curve** icon.

4) Deselect the curve, then drag and drop segments to move them away from the original curve.

The point where you split the curve is now larger than the remaining points visible on the curve, except for the curve start point which is also larger than the other points.

Figure 66: Splitting curves

Closing curves

1) Select an open and existing curve (Figure 67).

Figure 67: Closing curves
2) Select a point of the curve. Note that the start point of a curve is larger than the other points visible on the curve.

3) Click on the Close Bézier icon to close the curve. If the open curve was originally a closed and filled curve, then the original color will fill the curve when it is closed.

**Rotating and distorting curves**

1) Select the curve, then click on the **Rotate** icon on the Line and filling toolbar or the Mode toolbar. The points on the curve change color and shape (Figure 68).

2) Select one of the points on the curve and drag it to a new position to distort the curve. Movement will be restricted to the original border of the curve.

3) Select one of the control points at the end of the tangent line and rotate the distorted curve by dragging the cursor. The distorted curve will rotate about the center of rotation.

![Figure 68: Rotating and distorting curves](Image)
Chapter 4
Changing Object Attributes
Toolbars and menus

To change object attributes, such as color or border width, and so on, use the Line and Filling toolbar, the Text Formatting toolbar, or the context menus.

Line and Filling toolbar

If the Line and Filling toolbar is not displayed, go to View > Toolbars > Line and Filling to open the toolbar (Figure 69). The most common object attributes can be edited using this toolbar. For example, you can open the Line dialog by clicking on the Line icon and the Area dialog by clicking on the Area icon for access to more formatting options. The tools available from left to right on the Line and Filling toolbar are also shown in Figure 69.

![Line and Filling toolbar and available tools](image)

Figure 69: Line and Filling toolbar and available tools

![Text Formatting toolbar and available tools](image)

Figure 70: Text Formatting toolbar and available tools
Text Formatting toolbar

When you select text, the Line and Filling toolbar automatically changes to show the Text Formatting toolbar (Figure 70). You can also open the Text Formatting toolbar by selecting View > Toolbars > Text Formatting. The tools on this toolbar will not become active until text has been selected. The tools available from left to right on the Text Formatting toolbar are also shown in Figure 70.

Context menu

When an object is selected and you right-click on the object, a context menu (Figure 71) opens that applies to the selected object. This context menu provides access to the options available and allows you to change object attributes without having to open a dialog. Menu entries with a small triangle on the right-hand side contain a submenu with more menu options.

Figure 71: Example of a Context menu

Formatting lines

In LibreOffice the term line indicates both a freestanding segment (line), the outer edge of a shape (border), or an arrow. In most cases the properties of the line you can modify are its style (solid, dashed, invisible, and so on), its width, and its color.

To quickly format a line, first select the line then use the highlighted controls in Figure 72 on the Line and Filling toolbar to change the style, width, and color of the line.

Figure 72: Common line properties (style, width and color)
If you want to fully change the appearance of a line, then you need to use the Line dialog.

1) Select the line on your drawing.
2) Go to Format > Line on the main menu bar, or right-click on the line and select Line from the context menu, or select the Line icon from the Line and Filling toolbar to open the Line dialog (Figure 73) where you can set line properties. This dialog consists of four pages: Line, Shadow, Line Styles, and Arrow Styles, as explained in the following sections.
3) Click OK to close the dialog and save your changes. The preview box at the bottom of the dialog shows the effect of your changes on a line.

![Figure 73: Line properties dialog – Line page](image)

**Line properties**

The Line page is where you can set the basic parameters of the line and is divided into four sections as follows.

**Line properties section**

Use the Line Properties section on the left side to set the following parameters:

- **Line style** – several line styles are available from the drop-down list, but more line styles can be defined if necessary.
- **Color** – choose from the predefined colors in the drop down list or create a new color.
- **Width** – specifies the thickness of the line.
- **Transparency** – sets the transparency of a line. Figure 74 shows the effects of different percentages in transparency levels to lines when placed over an object.
Figure 74: Line transparency effect (0%, 25%, 50%, 75% left to right)

Arrow styles section
The Arrow styles section of the Line dialog is only applicable to individual lines and is not used for lines that form the borders of a shape.

- **Style** – sets the style of the two ends of a line. The left drop down menu is for where you start the line and the right drop down menu is for where you end the line.
- **Width** – specifies the thickness of the arrow endings
- **Center** – moves the center of the arrow endings to the end point of the line. Figure 75 shows the effects of selecting this option.
- **Synchronize ends** – makes the two line ends identical.

Figure 75: Default arrowheads (left) and centered arrowheads (right)

Corner and cap styles section
Corner and cap styles determine how the connection between two segments looks. To appreciate the difference between these styles, choose a thick line style and observe how the preview changes.

- **Corner style** – select the shape to be used at the corners of the line. In case of a small angle between lines, a mitered shape is replaced with a beveled shape.
- **Cap style** – select the style of the line end caps. The caps are added to inner dashes as well.

Arrowheads
A quick way to set the arrowheads for a selected line is to click on the Arrow Style icon in the Line and Filling toolbar to open the Arrowheads menu (Figure 76). Here you can select one of the many predefined arrowhead styles for the start and ending of the selected line.
Note

Arrowheads are only applicable to lines. They have no effect on the border of an object.

Figure 76: Arrowheads menu

Line shadows

Use the Shadow page (Figure 77) of the Line dialog to add and format the line shadow. The settings on this page are the same as those for shadows applied to other objects and are described in “Formatting shadows” on page 83.

A quicker way to apply a shadow to a line is using the Shadow icon on the Line and Filling toolbar. The main disadvantage of using the Shadow icon is that the shadow appearance will be constrained by the shadow settings of the default graphics style.

Figure 77: Line properties dialog – Shadow page
Line styles

Use the Line Styles page (Figure 78) of the Line dialog to create new line styles as well as to load previously saved line styles. It is normally better to create new styles when necessary than modify predefined styles.

Creating line styles

To create a new line style:

1) Choose Format > Line on the main menu bar, or right-click on the line and select Line from the context menu, or select the Line icon on the Line and Filling toolbar to open the Line dialog.
2) Click on the Line Styles tab.
3) Select from the Line style drop-down menu a style similar to the style you want to create.
4) Click Add and type a name for the new line style in the dialog that opens, then click OK.
5) Now define the new style. Start by selecting the line type for the new style. To alternate two line types (for example, dashes and dots) within a single line, select different types in the two Type boxes.
6) Specify the Number and Length (not available for dot style) of each of the types of line selected.
7) Set the Spacing between the various elements
8) If necessary, select Fit to line width so that the new style fits the width of the selected line.
9) The new line style created is available only in the current document. If you want to use the line style in other documents, click the Save Line Styles icon and type a unique filename in the Save as dialog that opens. Saved styles have the file extension of .sod.
10) To use previously saved line styles, click the Load Line Styles icon and select a style from the list of saved styles. Click Open to load the style into your document.
11) If necessary, click on the Modify button to change the name of the style.
12) Click OK to close the dialog and save any changes you have made.
Arrow styles

Use the Arrow Styles page (Figure 79) of the Line dialog to create new arrow styles, or modify existing arrow styles, or load previously saved arrow styles.

![Figure 79: Line dialog – Arrow Styles page](image)

Creating arrow styles

To create a new arrow style:

1) First draw a curve in the shape you want to use for the arrowhead, or create a shape and convert to a curve. The top of the shape must face upward, as shown in Figure 80, because this becomes the point of the arrow.

2) Select the shape and, if necessary, right-click and choose Convert > To Curve to convert the shape to a curve. If the shape is already a curve, To Curve will not be available.

3) With the selection handles showing, select Format > Line from the menu bar, or right-click and choose Line from the pop-up menu.

4) Go to the Arrow styles page, click the Add button, type a name for the new arrow style, and click OK. The new arrowhead style will be shown in the preview.

**Note**

The arrowhead must be a curve, which is something you can draw without lifting a pencil from the paper. For example, a star can be a curve, but a smiley face cannot be a curve because you have to reposition the pencil on the paper to draw eyes and a mouth on the face.
5) Now you can access the new style from the Arrow style list. When you select the name of the new style, it is shown at the bottom of the dialog.

6) The new arrowhead style created is available only in the current document. If you want to use this arrowhead style in other documents, click the Save Line Styles icon and type a unique filename in the Save as dialog that opens. Saved styles have the file extension of .sod.

7) To use previously saved arrowhead styles, click the Load Line Styles icon and select the style from the saved list of styles. Click Open to load the style into your document.

8) If necessary, click on the Modify button to change the name of the style.

9) Click OK to close the dialog and save any changes you have made.

**Formatting fill area**

The term area fill refers to the inside of an object, which can be a uniform color, gradient, hatching pattern, or bitmap as shown in Figure 81. An area fill can be made partly or wholly transparent and can throw a shadow.

![Figure 81: Different types of area fill](image)

The Line and Filling toolbar has the majority of the tools normally used to format graphic objects. If this toolbar is not showing, go to View > Toolbars > Line and Filling on the main menu bar. You can also use the Area dialog, described in “Using the Area dialog” on page 71.

To format the area of an object, select it so that the selection handles show. A wide number of default fillings are readily available from the Line and Filling toolbar (Figure 82). Select on the Area Style/Filling drop-down menus the type of fill required (Figure 83) from None, Color, Gradient, Hatching, or Bitmap and then select the style of fill to be used. Once you have decided on a predefined or custom fill, you can further refine it by adding a shadow or transparency.

![Figure 82: Common fill options highlighted](image)

![Figure 83: Area fill types](image)
**Color area fill**

To change the area fill of an object to a color (Figure 84):

1) Select the object you wish to edit.
2) On the Line and Filling toolbar, select **Color** from the Area Style/Filling drop down list.
3) Select a color from the drop-down list.

![Color area fill](image)

*Figure 84: Color area fill*

**Gradient area fill**

A gradient fill provides a smooth transition from one color to another. The transition pattern may vary from a simple linear transition to a more complex radial one. To change the area fill of an object to a gradient (Figure 85):

1) Select the object you wish to edit.
2) On the Line and Filling toolbar, select **Gradient** from the Area Style/Filling drop down list.
3) Select a gradient from the drop-down list.

![Gradient area fill](image)

*Figure 85: Gradient area fill*

**Hatching area fill**

When a hatching fill is applied it fills the complete area of the selected object. To change the area fill of an object to a hatching (Figure 86):

1) Select the object you wish to edit.
2) On the Line and Filling toolbar, select **Hatching** from the Area Style/Filling drop down list.
3) Select a hatching fill from the drop-down list.
You can fill an object only with a bitmap image but not a vector graphic image. To change the area fill of an object to a bitmap image (Figure 87):

1) Select the object you wish to edit.
2) On the Line and Filling toolbar, select Bitmap from the drop down list.
3) Select a bitmap fill from the drop-down list.

Using the Area dialog

In addition to using the Line and Filling toolbar, you can use the Area dialog to apply existing area fills with greater control or create your own area fill.

1) Select the object you wish to edit.
2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.
3) Click on the Area tab to open the Area page and to apply an area fill. LibreOffice includes several area fills already defined, but you can create area fills yourself. See “Creating new area fills” on page 73 for more information.
4) Select the type of area fill from the drop-down list: None, Color, Gradient, Hatching, or Bitmap. Types of area fill are explained below.
5) Select the style of area fill from the options that become available. The number of available options will depend on the type of area fill selected above.
6) Click OK to close the dialog and save your changes. The area fill will then appear in your selected object.
**Types of area fill**

- **Color fills** – select **Color** from the *Fill* drop down list and then select your required color from the list of available colors (Figure 88). A preview of the selected color appears at the bottom of the dialog.

  ![Figure 88: Area color dialog](image)

- **Gradient fills** – select **Gradient** from the drop down list and then select your required gradient from the list of available gradients (Figure 89). You can override the number of steps (increments) that should be applied to the gradient transition. To do so, deselect the **Automatic** option under *Increments* and then enter the number of steps required in the box to the right. A preview of the selected gradient appears at the bottom of the dialog.

  ![Figure 89: Area gradient dialog](image)

- **Hatching fills** – select **Hatching** from the drop down list and then select your required hatching from the list of available hatchings (Figure 90). You can apply a different background color by selecting the **Background color** option and choosing a color from the drop down list. A preview of the selected hatching appears at the bottom of the dialog.

  ![Figure 90: Area hatching dialog](image)

- **Bitmap fills** – select **Bitmaps** from the drop down list and then select your required bitmap from the list of available bitmaps (Figure 91). You can customize a large number of parameters. A preview of the selected bitmap appears at the bottom of the dialog.
Creating new area fills

The following sections describe how to create new fills and how to apply them. Although you can change the characteristics of an existing fill and then click the Modify button, it is recommended that you create new fills, or modify custom fills rather than the predefined ones, as these may be reset when updating LibreOffice.

Creating custom colors

On the Colors page (Figure 92), you can modify existing colors or create your own. You can also specify a new color either as a combination of the three primary colors Red, Green, and Blue, (RGB notation) or by percentages of Cyan, Magenta, Yellow, and Black (CMYK notation).

Creating new color

1) Select the object you wish to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon 📊 on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Colors tab to open the Colors page.

4) Enter a name for the new color in the Name box.

5) Select whether to define the color in RGB or CMYK. For RGB, specify the red (R), green (G) and blue (B) component on a 0 to 255 scale. For CMYK, specify the cyan (C), magenta (M), yellow (Y) and black (K) components from 0% to 100%.

6) Click the Add button. The color is now added to the Color drop down list.

7) Click OK to save your changes and close the dialog.
Modifying colors

1) Select the object you wish to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Colors tab to open the Colors page.

4) Select the color to modify from the list.

5) Enter the new values that define the color in RGB or CMYK.

6) Modify the name as required.

7) Click Modify to save your changes.

8) Click OK to close the dialog.

Editing colors

1) Select the object you wish to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Colors tab to open the Colors page.

4) Select the color to edit from the list.

5) Click on the Edit button to open the Color Picker dialog (Figure 93).

6) Modify the color components as required using RGB, CMYK or HSB (Hue, Saturation, Brightness).

7) Click OK to exit the Color Picker dialog.

8) Modify the name as required.
9) Click **Modify** on the Color dialog to save your changes.

10) Click **OK** to close the dialog.

**Saving and using new colors**

Any new color created is available only in the current document. If you want to use this color in other documents, click the **Save Color List** icon and type a unique filename in the **Save as** dialog that opens. The saved colors list has the file extension of .soc.

To use a previously saved color list, click the **Load Color List** icon and select from the file open dialog. Click **Open** to load the saved color list into Draw.

---

**Tip**

You can also add custom colors using **Tools > Options > LibreOffice > Colors**. This method makes the color available to all components of LibreOffice.

---

**Creating custom gradients**

To create a new gradient or to modify an existing one, select the Gradients tab from the Area dialog (Figure 94). Several types of gradients are predefined and in most cases changing the **From** and **To** colors will be sufficient to obtain the desired result.

It is highly recommended that you create a new gradient even if you just want to change the two colors, rather than modifying the predefined ones, which should only be used as starting points.
Creating new gradients

1) Select the object you wish to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Gradients tab to open the Gradients page.

4) Select the From and To colors from the drop down lists.

5) Select the type of gradient from the drop down list: Linear, Axial, Radial, Ellipsoid, Square or Rectangular. A preview of the gradient type is shown in the dialog.

6) Set all the properties as desired (very often the default values will work well). The properties used to create a gradient are summarized in Table 2. Depending on the type of gradient selected, some properties may be grayed out.

7) Click Add to add the newly created gradient to the list.

8) Type a name for the new gradient in the dialog that opens and click OK.

9) Click OK to close the dialog.

Table 2: Gradient properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Center X</td>
<td>For Radial, Ellipsoid, Square and Rectangular gradients, modify these values to set the horizontal offset of the gradient center.</td>
</tr>
<tr>
<td>Center Y</td>
<td>For Radial, Ellipsoid, Square and Rectangular gradients, modify these values to set the vertical offset of the gradient center.</td>
</tr>
<tr>
<td>Angle</td>
<td>For all the gradient types, specifies the angle of the gradient axis.</td>
</tr>
</tbody>
</table>
### Property | Meaning
--- | ---
Border | Increase this value to make the gradient start further away from the border of the shape.
From | The start color for the gradient. In the edit box below enter the intensity of the color: 0% corresponds to black, 100% to the full color.
To | The end color for the gradient. In the edit box below enter the intensity of the color: 0% corresponds to black, 100% to the full color.

**Modifying gradients**
1) Select the object you wish to edit.
2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.
3) Click on the Gradients tab to open the Gradients page.
4) Select the gradient to modify from the list.
5) Enter the new values for the properties that become available for change. See Table 2 for more information on gradient properties.
6) Click Modify to save your changes.
7) Click OK to close the dialog.

**Saving and using new gradients**
The new gradient created is available only in the current document. If you want to use this gradient in other documents, click the Save Gradients List icon and type a unique filename in the Save as dialog that opens. The saved gradients list has the file extension of .sog.

To use a previously saved gradients list, click the Load Gradients List icon and select from the file open dialog. Click Open to load the saved gradients list into Draw.

**Advanced gradient controls**
As discussed in “Creating custom gradients” on page 75, gradient properties can be configured using the properties given in the dialogs shown in Figure 94 and Table 2. However, LibreOffice provides advanced controls for gradients as follows.
1) Select the object you wish to edit.
2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.
3) Click on the Gradients tab to open the Gradients page (Figure 94).
4) Select the type of gradient you want to use for your object from the Type drop down list. Properties you can adjust will depend on the gradient type you have selected and these are explained below.
5) Go to View > Toolbars > Mode on the main menu bar, click on the Effects icon on the Line and Filling toolbar to open the Mode toolbar.
6) Click on the Gradient icon in the Mode toolbar (Figure 95). This displays a dashed line connecting two colored squares. The colors show the From and To colors that are used for the selected gradient (Figure 96).
7) For **linear gradients** – move the square corresponding to the *From* color to change where the gradient starts (border value). Move the square corresponding to the *To* color to change the orientation (angle value).

8) For **axial gradients** – move the *To* color to change both the angle and border properties of the gradient. Only the square corresponding to the *To* color can be moved.

9) For **radial gradients** – move the *From* color to modify the border property to set the width of the gradient circle. Move the *To* color to change the point where the gradient ends (Center X and Center Y values).

10) For **ellipsoid gradients** – move the *From* color to modify the border property to set the size of the gradient ellipsoid. Move the *To* color to change the angle of the ellipsoid axis and the axis itself.

11) For **square and rectangular gradients** – move the *From* color to modify the border to set the size of the gradient square or rectangle and the angle of the gradient shape. Move the *To* color to change the center of the gradient.

12) Click **OK** to save your changes and close the Area dialog.

---

**Note**
Moving the squares will have different effects depending on the type of gradient. For example, for a linear gradient, the start and end squares of the gradient will always be situated to either side of the center point of the object.

---

**Creating custom hatching patterns**
To create new hatching patterns or modify existing ones, select the **Hatching** tab of the Area dialog (Figure 97). As with gradients and colors, it is better to create a new hatching pattern rather than modify a predefined one. The properties that can be set for a hatching pattern are shown in Table 3.
Creating new hatching patterns

1) Select the object you wish to edit.
2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.
3) Click on the Hatching tab to open the Hatching page.
4) Select as a starting point a pattern similar to the one that will be created.
5) Modify the properties of the lines forming the pattern. A preview is displayed in the window below the available patterns. More information on hatching properties is shown Table 3.
6) Click Add and type a name for the new gradient in the dialog that opens, then click OK.
7) Click OK to close the dialog.

![Figure 97: Creating a new hatching pattern](image)

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spacing</td>
<td>Determines the spacing between two lines of the pattern. As the value is changed the preview window is updated.</td>
</tr>
<tr>
<td>Angle</td>
<td>Use the mini map below the numerical value to quickly set the angle formed by the line to multiples of 45 degrees. If the required angle is not a multiple of 45 degrees, just enter the desired value in the edit box.</td>
</tr>
<tr>
<td>Line type</td>
<td>Set single, double or triple line for the style of the pattern.</td>
</tr>
<tr>
<td>Line color</td>
<td>Use the list to select the color of the lines that will form the pattern.</td>
</tr>
</tbody>
</table>
Modifying hatching patterns

1) Select the object you wish to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Hatching tab to open the Hatching page.

4) Select the hatching pattern to modify from the list.

5) Enter the new values for the properties that become available for change. See Table 3 for more information on gradient properties.

6) Click Modify to save your changes.

7) Click OK to close the dialog.

Saving and using new hatching patterns

The new hatching pattern created is available only in the current document. If you want to use this hatching pattern in other documents, click the Save Hatches List icon and type a unique filename in the Save as dialog that opens. The saved hatches list has the file extension of .soh.

To use a previously saved hatches list, click the Load Hatches List icon and select from the file open dialog. Click Open to load the saved hatches list into Draw.

Figure 98: Advanced formatting for bitmap fill

Working with bitmap fills

1) Select the object fills to edit.

2) Go to Format > Area on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select Area to open the Area dialog.

3) Click on the Area tab to open the Area page.

4) Select Bitmap from the Fill drop down list (Figure 98).
5) Select from the list of bitmaps the one to be used to fill the area. Note that any imported bitmaps will become available in the list.

6) Set the size, position and offset parameters (as applicable). See Table 4 for more information on bitmap properties. The best way to acquire understanding of these parameters is to use them. Figure 99 shows some examples of bitmap fills and the parameters used.

7) Click **OK** to close the dialog.

![Examples of bitmap fill](image)

**Figure 99: Examples of bitmap fill**

<table>
<thead>
<tr>
<th><strong>Property</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Size – Original</td>
<td>Select this box to retain the original size of the bitmap.</td>
</tr>
<tr>
<td>Size – Relative</td>
<td>To rescale the object, deselect Original and select Relative. The Width and Height edit boxes are enabled.</td>
</tr>
<tr>
<td>Size – Width</td>
<td>When Relative is selected 100% means that the bitmap original width will be resized to occupy the whole fill area width, 50% means that the width of the bitmap will be half that of the fill area.</td>
</tr>
<tr>
<td>Size – Height</td>
<td>When Relative is selected 100% means that the bitmap original height will be resized to occupy the whole fill area height, 50% means that the height of the bitmap will be half that of the fill area.</td>
</tr>
<tr>
<td>Position – Anchor</td>
<td>Select from the map the place within the area to which the bitmap should be anchored.</td>
</tr>
<tr>
<td>Map</td>
<td></td>
</tr>
<tr>
<td>Position – Tile</td>
<td>When this option is selected, the bitmap will be tiled to fill the area. The size of the bitmap used for the tiling is determined by the Size settings.</td>
</tr>
<tr>
<td>Position – X offset</td>
<td>When Tile is enabled, enter in this box the offset for the width of the bitmap in percentage values. 50% offset means that Draw will place the middle part of the bitmap at the anchor point and start tiling from there.</td>
</tr>
<tr>
<td>Position – Y offset</td>
<td>This will have a similar effect to the X offset, but will work on the height of the bitmap.</td>
</tr>
</tbody>
</table>
### Property | Meaning
--- | ---
Position – Autofit | Stretches the bitmap to fill the whole area. Selecting this option disables all the size settings.
Offset – Row | If Tile is enabled, offsets the rows of tiled bitmaps by the percentage entered in the box so that two subsequent rows are not aligned.
Offset – Column | If Tile is enabled, offsets the columns of tiled bitmaps by the percentage entered in the box so that two subsequent columns of bitmaps are not aligned.

## Creating and importing bitmaps

You can add (import) new bitmap fills or create your own pattern on an 8x8 grid using the *Bitmaps* tab of the Area dialog (Figure 100).

![Creating a new bitmap](image)

### Creating bitmap fills

1. Select the object you wish to edit.
2. Go to *Format > Area* on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select *Area* to open the Area dialog.
3. Click on the *Bitmap* tab to open the Bitmap page.
4. Select *Blank* as the bitmap type to activate the *Pattern Editor*.
5. Select the *Foreground* and *Background* colors.
6. Start creating the pattern by clicking with the left mouse button the squares (pixels) that you want in the foreground color. Use the right mouse button to apply the background color. Check the preview window to see if the desired effect is achieved.
7) Click **Add** to save the pattern and type a name for the new gradient in the dialog that opens, then click **OK**.

8) Click **OK** to close the dialog.

**Note**
You only modify bitmaps that you have created in LibreOffice. The bitmaps supplied with LibreOffice or imported bitmaps cannot be changed or modified using LibreOffice.

**Modifying bitmaps**
1) Select the object you wish to edit.

2) Go to **Format > Area** on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select **Area** to open the Area dialog.

3) Click on the **Bitmap** tab to open the Bitmap page.

4) Select a bitmap that you have created from the list.

5) Make the changes to your bitmap using the **Pattern Editor** and the color drop down lists.

6) Click **Modify** to save your changes.

7) If necessary, type a new name in the dialog that opens and click **OK**.

8) Click **OK** to close the dialog.

**Importing bitmaps**
To import a bitmap created in another program:
1) Click **Import** and a file browser dialog opens.

2) Browse to the directory containing the bitmap file and select it, then click **Open**.

3) Type a name for the imported bitmap and click **OK**.

**Saving and using new bitmaps**
The new bitmap created is available only in the current document. If you want to use this bitmap in other documents, click the **Save Bitmap List** icon and type a unique filename in the **Save as** dialog that opens. The saved bitmap list has the file extension of .sob.

To use a previously saved bitmap list, click the **Load Bitmap List** icon and select from the file open dialog. Click **Open** to load the saved bitmap list into Draw.

**Formatting shadows**
Shadowing can be applied to lines, shapes and text.

To quickly apply a shadow to a line or shape only, first select the object and then click on the **Shadow** icon in the Line and Filling toolbar. The shadow applied using this method cannot be customized and is set to default settings.

For a more control when adding shadows to an object, you have to use the Shadow page on the Area dialog (Figure 101) as follows:
1) Select the object you wish to edit.

2) Go to **Format > Area** on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select **Area** to open the Area dialog.
3) Click on the Shadow tab to open the Shadow page.
4) Select **Use shadow** and the shadow options become active.
5) In **Position** select the direction in which the shadow is cast.
6) In **Distance** enter a distance in the text box to set spacing between the object and the shadow.
7) In **Color** select a color from the drop down list to determine the color of the shadow.
8) In **Transparency** enter a percentage in the text box to determine the amount of transparency for the shadow.
9) Click **OK** to save your changes and close the dialog.

**Transparency formatting**

Transparency is applicable to objects as well as shadows. To apply transparency to lines, refer to “Formatting lines” on page 63; for shadows, refer to “Formatting shadows” on page 83.

To apply transparency to objects using the Transparency page on the Area dialog (Figure 102):

1) Select the object you wish to edit.
2) Go to **Format > Area** on the main menu bar, or click on the Area icon on the Line and Filling toolbar, or right-click on the object and select **Area** to open the Area dialog.
3) Click on the **Transparency** tab to open the Transparency page.
4) To create a uniform transparency, select **Transparency** and enter a percentage in the text box.
5) To create a gradient transparency (so that the area becomes gradually transparent) select **Gradient** and select the type of gradient transparency from the drop down list: **Linear**, **Axial**, **Radial**, **Ellipsoid**, **Quadratic** or **Square**.
6) Set the parameters for the type of the gradient transparency you selected above. Refer to Table 5 for a description of the properties. The available parameters will depend on the type of gradient transparency selected above.
7) Click **OK** to save your changes and close the dialog.
Table 5: Gradient transparency properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Center X</td>
<td>For Radial, Ellipsoid, Quadratic and Square gradients, modify these values to set the horizontal offset of the gradient center.</td>
</tr>
<tr>
<td>Center Y</td>
<td>For Radial, Ellipsoid, Quadratic and Square gradients, modify these values to set the vertical offset of the gradient center.</td>
</tr>
<tr>
<td>Angle</td>

<td>Value for the starting transparency gradient. 0% is fully opaque, 100% means fully transparent.</td>
</tr>
<tr>
<td>End value</td>
<td>Value for the ending transparency gradient. 0% is fully opaque, 100% means fully transparent.</td>
</tr>
</tbody>
</table>

Using styles

Suppose that you want to apply the same area fill, line thickness, and border to a set of objects. This repetitive process can be greatly simplified by the use of styles. Styles allow you to define a formatting template (a style) and then to apply that style to multiple objects. For more information on styles, see the Writer Guide Chapter 6 Introduction to Styles.
Linked graphics styles

Graphics styles support inheritance; that is, a style can be linked to another (parent) style so that it inherits all the formatting settings of the parent. You can use this property to create families of styles.

For example, if you need multiple boxes that differ in color but are otherwise identically formatted, the best way to proceed is to define a generic style for the box including borders, area fill, font, and so on. Then create a number of hierarchically dependent styles which differ only in the fill color attribute. If you then need to change the font size or the thickness of the border, it is sufficient to change the parent style and all the other linked styles will change accordingly.

Creating graphics styles

You can create a new graphics style in two ways:

- Using the Style and Formatting dialog.
- From a selected object.

Using Styles and Formatting dialog

1) Click on the **Styles and Formatting** icon on the Line and Filling toolbar or press the **F11** key to open the Styles and Formatting dialog (Figure 103).

2) Click on the Graphics Styles icon in the top left corner of the Styles and Formatting dialog. This will open a list of styles available for use with graphics.

3) Select the style you want to use in the Styles and Formatting dialog.

4) Right-click and select **New** to open the Graphics Styles dialog (Figure 104).

5) Click on the Organizer tab to the Organizer page.

6) Give your new graphics style a memorable file name.

7) Use the various pages and available options in the Graphics Styles dialog to format and categorize your new style.

8) Click **OK** when finished to save your new graphics style and close the dialog.
The Graphics Styles dialog consists of several pages that may be grouped as follows:

- **Organizer** – contains a summary of the style and its hierarchical position.
- **Font, Font Effects, Indents & Spacing, Alignment, Tabs and Asian Typography** – set the properties of the text inserted in a text box or in a graphic object.
- **Dimensioning** – used to set the style of dimension lines.
- **Text, Text Animation, Connector, Line, Area, Shadowing, and Transparency** – determine the formatting of a graphic object.

**Note**

When styles are linked, changing a color for example will change the color in all linked styles. Sometimes this is exactly what you want; at other times you do not want the changes to apply to all linked styles. It pays to plan ahead.

**Using a selected object**

You can create a new style from an object that has already been formatted. This can be text or graphics:

1. Select the object you want to use to create your new style.
2. Open the Styles and Formatting dialog and click the **New Style from Selection** icon.
3. In the Create Style dialog that opens, type a name for the new style. This dialog also shows existing custom styles of that are available.
4. Click **OK** to save the new style.

**Modifying a graphics style**

To modify an existing style:

1. Right-click on the style in the Styles and Formatting dialog.
2. Select **Modify** from the context menu to open the Graphic styles dialog and is the same dialog used when creating a new graphics style (Figure 104).
3. Make the required changes to the style.
4. Click **OK** to save your changes and close the dialog.

**Updating from a selection**

To update a style from a select object:

1. Select an object that uses the format you want to adopt as a style.
2. In the Styles and Formatting dialog, select the style you want to update and then click the **Update Style** icon.
Applying graphics styles

You can apply a graphics style using the Styles and Formatting dialog. First make sure that the graphics styles are shown (Figure 103), then do one of the following:

- Select the object to which you want to apply a graphics style and double-click on the name of the style you want to apply.

- Click the Fill Format mode icon, position the cursor on the object to be styled and click the mouse button. This mode remains active until you turn it off, so you can apply the same style to several objects. To quit Fill Format mode, click the Fill Format mode icon again or press the Esc key.

- When Fill Format mode is active, a right-click anywhere in the document cancels the last Fill Format action. Be careful not to accidentally right-click and thus undo actions you want to keep.

Tip

At the bottom of the Styles and Formatting window is a drop-down list. You can choose to show all styles or groups of styles such as applied styles or custom styles.

Deleting graphics styles

You cannot delete any of the predefined styles in LibreOffice, even if you are not using them. You can only delete user-defined (custom) styles. However, before you delete a custom style, make sure the style is not in use. If an unwanted style is in use, replace it with a substitute style.

To delete custom styles, right-click on a style in the Styles and Formatting dialog and click Delete on the context menu. Click Yes in the confirmation box that opens and the style is deleted.

Applying special effects

As well as the basic actions of moving and resizing an object, a number of special effects can also be applied to objects in Draw. Several of these effects are readily available in the Mode toolbar (Figure 105). If the Mode toolbar is not showing, select it from View > Toolbars > Mode.

This section describes how to rotate, flip, or distort an object, and two ways of setting an object in a circle.

The tools are described in the following sections with the exception of the 3D rotation tool, which is described in Chapter 7 Working with 3D Objects.

Figure 105: Mode toolbar and available tools
Rotating graphic objects

Rotation of an object can be carried out manually or using a dedicated dialog, just like changing object position and size.

**Manual rotation**

1) Click on an object and the selection handles will show.

2) Click the Rotate icon in the Line and Filling or Mode toolbars. The selection handles change shape and color (Figure 106).

3) If necessary, click and drag the pivot point for rotation to change the way an object is rotated. The pivot point is a circle and appears, by default, in the middle of the selected object. Normally the center of an object will be just fine, but on some occasions you may wish to rotate around a corner or even around a point outside the object.

4) Move the mouse over one of the corner handles and the cursor changes shape.

5) Click the mouse and move in the direction in which you want to rotate the object. Only the corner selection handles are active for rotation.

6) To restrict the rotation angles to multiples of 15 degrees, press and hold the Shift key while rotating the object. This is very handy for rotating objects through a right angle, for example from portrait to landscape.

7) When satisfied release the mouse button.

**Using the Rotation dialog**

Instead of rotating a graphic object manually, you can use the Rotation dialog (Figure 107) for more precise control when rotating an object.

1) Select the object so that the selection handles are displayed.

2) Press F4 key, or select **Format > Position and Size** on the main menu bar, or right-click on the object and select Position and Size from the context menu to the Position and Size dialog.

3) Click on the **Rotation** tab to open the Rotation page.

4) In the **Pivot point** section, enter a figure in **Position X** and/or **Position Y** boxes to reposition the pivot point relative to the top left corner of the drawing, or select a position for the pivot point in **Default settings**. The default position for the pivot point is the center of the object.
In the **Rotation angle** section, enter an angle in the **Angle** box by which to rotate the object, or click and drag the **Rotation Angle** indicator in **Default settings** until you reach the required angle. As you click and drag, the angle is shown in the **Angle** box.

6) Click **OK** to save your changes and close the dialog.

### Flipping objects

**Quick flipping**

The quickest and easiest method to flip an object horizontally or vertically is as follows:

1) Select an object and the selection handles will be displayed.

2) Go to **Modify > Flip** and select **Horizontally** or **Vertically** on the main menu bar, or right-click and select **Flip > Horizontally** or **Flip > Vertically** from the context menu and the selected object will be flipped to face the other direction.

**Using the Flip tool**

The **Flip** tool on the Mode or Line and Filling toolbars can also be used to flip an object. Using this tool, you can also change the position and angle that the object flips over (Figure 108).

1) Select an object and the selection handles will be displayed.

2) Click on the **Flip** icon and the **axis of symmetry** appears as a dashed line through the middle of the object. The object will be flipped about this axis of symmetry.

3) Click and drag one or both ends of the axis of symmetry to set the orientation of the axis.

4) Place the cursor over one of the object selection handles until it changes shape.

5) Click and drag the object across to the other side of the axis of symmetry until the object appears flipped over. The angle and position of the flip will depend on the angle and position of the axis of symmetry.

6) Release the mouse button and your object is flipped.
If you press the Shift key while moving the axis of symmetry, it will rotate in 45 degree increments.

**Mirror copies**

At the moment there is no mirror command existing in Draw. However, mirroring an object can be emulated by using the **Flip** tool as follows:

1. Select the object you want to make a mirror copy of and copy the object to the clipboard.
2. Select the **Flip** tool on the Mode or Line and Filling toolbars.
3. Move the axis of symmetry to the desired location of the mirror axis, then flip the object.
4. Click on an empty area of the page to deselect the object.
5. Paste from the clipboard to put a copy of the object back into its original location and now you have a mirror copy.
6. If necessary, select both objects and realign them by going to **Modify>Alignment** on the main menu bar, or right-click and select **Alignment** from the context menu and then select the type of alignment.

**Distorting images**

Three tools on the Mode toolbar let you drag the corners and edges of an object to distort the image.

- **Distort** distorts an object in perspective.
- **Set to Circle (slant)** creates a pseudo three-dimensional effect.
- **Set in Circle (perspective)** creates a pseudo three-dimensional effect.
In all three cases you are initially asked if you want to transform the object to a curve. This is a necessary first step, so click Yes. Then you can move the object handles to produce the desired effect. The results of using these tools are shown in the following figures.

**Distorting**

Select an object and click on the Distort icon on the Mode toolbar. After converting to a curve as requested, move the handles to stretch the object. The corner handles distort the corners, the vertical midpoint handles distort the figure horizontally and the horizontal ones distort it vertically (Figure 109).

![Figure 109: Distorting an image](image)

**Setting in circle (perspective)**

Select an object and click on the Set in Circle (perspective) icon in the Mode toolbar. After converting to a curve, move the object handles to give a pseudo three-dimensional perspective) (Figure 110).

![Figure 110: Setting an image to a circle with perspective](image)
**Setting to circle (slant)**

Select an object and click on the **Set to Circle (slant)** icon in the mode toolbar. After converting to a curve, move the object handles to give a pseudo three-dimensional slant perspective (Figure 111).

![Setting an image to a circle with slant](image)

**Figure 111**: Setting an image to a circle with slant

| Note | Transforming an object into a curve is a safe operation, but it cannot be reversed other than by clicking the **Undo** button. |

**Dynamic gradients**

You can control transparency gradients in the same manner as color gradients and both types of gradient can be used together. With a transparency gradient, the direction and degree of object fill color changes from opaque to transparent. In a color gradient, the fill changes from one color to another, but the degree of transparency remains the same.

Two icons are present on the Mode toolbar to dynamically control transparency and color gradients. Even if you have not assigned transparency to an object with a color fill, you can control the transparency by clicking on the **Transparency** icon. This defines a transparency gradient and a dashed line connecting two squares appears on the object. Move the two squares to modify the gradient. You can define the direction of the gradient (vertical, horizontal, or at any angle) and the spot at which the transparency begins.

A regular color gradient is defined in the same manner. Select an object, then select a gradient fill from the Gradients page of the Area dialog (Figure 94 on page 76). The **Gradient** icon is now active on the Mode toolbar. When you click on the gradient icon, a dashed line connecting two squares appears on the object, just as it does for a transparency gradient.

In both transparency gradient and gradient fill, click outside the object to set the gradient.

| Note | Moving the squares will have different effects, depending on the type of gradient. For example, for a linear gradient, the start and end squares of the gradient will always be situated to either side of the center point of the object. |
**Example 1**
A single color object and a transparency gradient, covering part of the underlying object. The gradient can be dynamically adjusted; the direction of transparency by moving the white square or the distance over which it is applied by moving the black square (Figure 112).

![Figure 112: Example 1 of a dynamic gradient](image)

**Example 2**
An object with a color gradient, completely covering another object. The gradient is adjusted dynamically by moving the squares – the color of the square relating to the increase or decrease in that color (Figure 113).

![Figure 113: Example 2 of a dynamic gradient](image)

**Example 3**
An object with both color and transparency gradients, partly covering the underlying object (Figure 114).

![Figure 114: Example 3 of a dynamic gradient](image)
Chapter 5
Combining Multiple Objects
Grouping, Combining, Merging, and Positioning
Grouping objects

Grouping of objects is similar to putting objects into a container. You can move the objects as a group and apply global changes to the objects within the group. A group can always be undone and the objects that make up the group can always be manipulated separately.

Temporary grouping

A temporary grouping is when several objects are selected. Any changes to object parameters that you carry out are applied to all of the objects within the temporary group. For example, you can rotate a temporary group of objects in its entirety.

To cancel a temporary grouping of objects, simply click outside of the selection handles displayed around the objects.

Grouping

To group objects together permanently:

1) Select the objects by clicking on each object in turn while holding down the Shift key, or use the Select icon on the Drawing toolbar and draw a selection rectangle around the objects using the cursor. Selection handles will then appear around all the objects within the group (Figure 115).

2) Right-click on the group and select Group from the context menu, or go to Modify > Group on the main menu bar, or use the keyboard shortcut Control+Shift+G.

When objects are grouped, any editing operations carried out on that group are applied to all objects within the group. If you click on one object in the group, the whole group is selected.

The objects within a group also retain their own individual properties and can be edited independently. See “Editing individual objects” on page 97 for more information.

![Figure 115: Grouping objects](image)

Ungrouping

To undo or ungroup a group of objects:

1) Select the group of objects which is indicated by selection handles appearing around the group.

2) Right-click on the group and select Ungroup from the context menu, or go to Modify > Ungroup on the main menu bar, or use the keyboard shortcut Control+Alt+Shift+G.
Editing individual objects

You can individually edit an object within a group without ungrouping the group.

1) Right-click on the group and select **Enter group** from the context menu, or go to **Modify > Enter Group** on the main menu bar, or press the F3 key, or double-click on the group. When you enter a group, objects outside the group cannot be selected for editing and appear pale (Figure 116).

2) Once inside the group, click on any object to individually edit it (Figure 117).

3) To leave a group, right-click on the group and select **Exit group** from the context menu, or go to **Modify > Exit Group** on the main menu bar, or use the keyboard combination Ctrl+F3 key, or double-click outside the group.

Figure 116: Entering groups

Figure 117: Editing inside a group

Nesting groups

You can create a group of groups, which is more commonly known as nesting groups. When you create nested groups, Draw retains the individual group hierarchy and remembers the order in which groups were selected. That is, the last individual group selected will be on top of all the other groups within a nested group.

Ungrouping and entering a nested group works in exactly the same way as for individual groups in “Grouping” and “Ungrouping” as above.

Combining objects

Combining objects is a permanent merging of objects that creates a new object. The original objects are no longer available as individual entities and cannot be edited as individual objects. Any editing of a combined object affects all the objects that were used when combination was carried out.
Combining

1) Select the objects you want to combine.
2) Right-click on the selection and select Combine from the context menu, or go to Modify > Combine on the main menu bar, or use the keyboard combination Control+Alt+Shift+K.

![Figure 118: Combining objects](image)

At first glance, the results can seem rather surprising, but once you understand the rules governing combination in Draw, combining objects will become clearer.

- The attributes (for example, area fill) of the resulting object are those of the object furthest back. In Figure 118, it is the circle and Figure 119 it is the yellow rectangle.
- Where the objects overlap, the overlapping zone is either filled or empty depending on whether the overlap is even numbered or odd numbered. Figure 119 Shows that where the overlap number is even, you get an empty space and where the overlap number is odd, you get a filled area.

![Figure 119: Area fill on overlapping objects](image)

<table>
<thead>
<tr>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can reorder objects so they are further back or further forward in the arrangement order. Right-click on the object and select Arrangement from the context menu. See also “Positioning objects” on page 104.</td>
</tr>
</tbody>
</table>

Splitting a combination

An object which has been combined from several objects can be split into individual objects by going to Modify > Split on the main menu bar, or right-clicking on the combined object and selecting Split from the context menu, or using the keyboard shortcut Control+Alt+Shift+K. However, the original objects will retain the formatting of the combined object and will not revert back to their original formatting.

In Figure 120, the left graphic is the original object, as shown on the left in Figure 119. The right graphic is the result of splitting and the individual objects have taken the formatting of the combined object, as shown on the right in Figure 119.
Breaking a combined object

When an object is combined from several objects, the combined object can be broken into its constituent parts by going to **Modify > Break** on the main menu bar. This means that the original objects are broken into their constituent parts; for example, a rectangle will be broken into four separate lines and the area fill will be lost, as shown by the right graphic in Figure 121. The left graphic in Figure 121 is the original combined object.

Connecting lines

The constituent parts of an object can be connected together by selecting all the constituent parts of the object and going to **Modify > Connect** on the main menu bar. This connects the parts together and closes the object resulting in the area becoming filled with the area fill it had before the object was broken.

Merging, subtracting, or intersecting objects

After you have selected more than one object, the Merge, Subtract, and Intersect functions become available, allowing you to create a new object with a new shape. After selecting several objects, go to **Modify > Shapes** on the main menu bar or right-click on the selected objects and select **Shapes** from the context menu.
**Merge**

When you merge objects, a new object is created with a shape that follows the shape of the merged objects. The area fill of the merged object is determined by the area fill of the object that is at the rear of all the other objects, as shown in Figure 122.

**Subtract**

When you subtract objects, the objects at the front are subtracted from the object behind. This leaves a blank space that the subtracted objects occupied (Figure 123).

![Figure 123: Subtracting objects](image)

**Intersect**

When you intersect objects, the front objects and the exposed area of the object at the rear are removed. This creates a new object from the area of the object at the rear that was covered by the objects at the front (Figure 124).

![Figure 124: Intersecting objects](image)

**Practical example**

The example in Table 6 shows how you can use the merge, subtract, and intersect functions to create a knife with a wooden handle.

**Table 6: Creating a knife**

| Draw an ellipse and then a rectangle overlapping half of its width. | ![Diagram](image) |

---

100 LibreOffice 4.1 Draw Guide
Select both shapes, right-click, and select **Shapes > Subtract** from the context menu.

Draw another rectangle and put it over the top half of the ellipse.

Select both shapes, right-click, and select **Shapes > Subtract** from the context menu.

Draw a small ellipse covering just the lower right corner.

Select both shapes, right-click, and select **Shapes > Subtract** from the context menu. The knife blade shape is now complete.

To make the handle, draw a rectangle and an ellipse.

Merge the shapes together.

Position the handle on the blade. Select the handle and blade, then group together to create a drawing of the knife.

---

**Duplication and cross fading**

**Duplication**

Duplication makes copies of an object while applying a set of changes (such as color or rotation) to the duplicates.

![Duplicate dialog](image)

*Figure 125: Duplicate dialog*
To duplicate an object or group of objects:

1) Select an object or group of objects.
2) Go to **Edit > Duplicate** on the main menu bar or use the keyboard shortcut **Shift+F3** to open the Duplicate dialog (Figure 125).
3) Select the number of copies, placement, enlargement, and the start and end colors for your duplicate copies.
4) Click **OK** and your duplicate copies are created. An example of a duplication is shown in Figure 126. Each duplicate object is a separate object.
5) To group the duplicate objects into one group, see “Error: Reference source not found” on page Error: Reference source not found.
6) To combine the duplicate objects into one object, see “Combining objects” on page 97.

The **Duplicate** dialog (Figure 125) has the following options:

- **Number of copies** – enter the number of copies you want to make.
- **Placement** – sets the position and rotation of a duplicate object with respect to the selected object.
  - **X axis** – enter the horizontal distance between the centers of the selected object and the duplicate object. Positive values shift the duplicate object to the right and negative values shift the duplicate object to the left.
  - **Y axis** – enter the vertical distance between the centers of the selected object and the duplicate object. Positive values shift the duplicate object down and negative values shift the duplicate object up.
  - **Angle** – enter the angle (0 to 359 degrees) by which you want to rotate the duplicate object. Positive values rotate the duplicate object in a clockwise direction and negative values in a counterclockwise direction.
- **Enlargement** – sets the size of a duplicate object.
  - **Width** – enter the amount by which you want to enlarge or reduce the width of the duplicate object.
  - **Height** – enter the amount by which you want to enlarge or reduce the height of the duplicate object.
- **Colors** – sets the colors for the selected object and the duplicate object. If you make more than one copy, these colors define the start and end points of a color gradient.
  - **Start** – choose a color for the selected object.
– **End** – choose a color for the duplicate object. If you are making more than one copy, this color is applied to the last copy.

**Cross-fading**

Cross-fading transforms one object shape into another object shape. The result is a new group of individual objects that includes the start and end objects with the intermediate steps show the transformation from one object shape to another object shape.

To cross-fade two objects:
1) Select two objects and go to **Edit > Cross-fading** on the main menu bar to open the Cross-fading dialog (Figure 127).
2) Select the number of increments for the transformation.
3) If necessary, select **Cross-fade attributes** and **Same orientation**.
4) Click **OK** to perform the cross-fading. An example of cross-fading is shown in Figure 128. The object created is a group of objects.
5) To ungroup this group of objects so that you can use the individual objects, see “Ungrouping” on page 96.

![Cross-fading dialog](image1.png)

*Figure 127: Cross-fading dialog*

![Cross-fading example](image2.png)

*Figure 128: Cross-fading example*

The options available in the **Cross-fading** dialog (Figure 127) are:

- **Increments** – enter the number of shapes you want between the two selected objects.
- **Cross-fade attributes** – applies cross-fading to the line and fill properties of the selected objects. For example, if the selected objects are filled with different colors, a color transition between the two colors is applied.
- **Same orientation** – applies a smooth transition between the selected objects.
Positioning objects

Arranging objects

When you combine, merge, subtract, or intersect objects, the end result varies depending on which object is at the front and which object is at the back. Each new object that you place on a drawing automatically becomes the front object and all the other objects move backwards in the positioning order. Arranging objects allows you to change the order in which objects are positioned.

First select one or more objects, then click on the Arrange icon on the Line and Filling toolbar to open the Position toolbar (Figure 129). The tools on the Position toolbar are as follows:

- **Bring to Front** – brings the selected object to the front of the group.
- **Bring Forward** – brings the selected object forward one step.
- **Send Backward** – sends the selected object one step backward.
- **Send to Back** – sends the selected object to the back of the group.
- **In Front of Object** – moves the selected object in front of another selected object.
- **Behind Object** – moves the selected object behind another selected object.
- **Reverse** – reverses the order of the selected objects. This tool is grayed out if only one object is selected.

![Position toolbar](image)

Figure 129: Position toolbar

Aligning objects

To make your drawing look more professional, you can align objects with each other. Select one or more objects and click on on the Line and Filling toolbar to open the Align toolbar (Figure 130). The tools on the Align toolbar are as follows:

- **Left** – aligns the left edges of the selected objects. If only one object is selected, the left edge of the object is aligned to the left page margin.
- **Centered** – horizontally centers the selected objects. If only one object is selected, the center of the object is aligned to the horizontal center of the page.
- **Right** – aligns the right edges of the selected objects. If only one object is selected, the right edge of the object is aligned to the right page margin.
- **Top** – vertically aligns the top edges of the selected objects. If only one object is selected, the top edge of the object is aligned to the upper page margin.
• **Center** – vertically centers the selected objects. If only one object is selected, the center of the object is aligned to the vertical center of the page.

• **Bottom** – vertically aligns the bottom edges of the selected objects. If only one object is selected, the bottom edge of the object is aligned to the lower page margin.

![Align Objects](image)

*Figure 130: Align toolbar*

---

**Distributing objects**

Distributing objects allows you to space three or more objects evenly along the horizontal axis or the vertical axis. Objects are distributed using the outermost objects in the selection as base points for spacing.

Select at least three objects, then go to **Modify > Distribution** on the main menu bar or right-click and select **Distribution** from the context menu to open the Distribution dialog (Figure 131). The options available are explained as follows:

• **Horizontal** distribution specifies the horizontal distribution between the selected objects.
  - **None** – does not distribute the objects horizontally.
  - **Left** – distributes the selected objects so that the left edges of the objects are evenly spaced from one another.
  - **Center** – distributes the selected objects so that the horizontal centers of the objects are evenly spaced from one another.
  - **Spacing** – distributes the selected objects horizontally so that the objects are evenly spaced from one another.
  - **Right** – distributes the selected objects so that the right edges of the objects are evenly spaced from one another.

![Distribution](image)

*Figure 131: Distribution dialog*
• **Vertical** distribution specifies the vertical distribution between the selected objects.
  
  - *None* – does not distribute the objects vertically.
  - *Top* – distributes the selected objects so that the top edges of the objects are evenly spaced from one another.
  - *Center* – distributes the selected objects so that the vertical centers of the objects are evenly spaced from one another.
  - *Spacing* – distributes the selected objects vertically so that the objects are evenly spaced from one another.
  - *Bottom* – distributes the selected objects so that the bottom edges of the objects are evenly spaced from one another.
Chapter 6
Editing Pictures

Raster Graphics
Introduction

Earlier chapters of the Draw Guide have dealt only with vector graphics. However, Draw also contains a number of functions for handling raster graphics (bitmaps) such as photographs and scanned pictures, including import, export, and conversion from one format to another.

Draw can read all the majority of graphic file formats. It has a subset of capabilities similar to raster graphics programs like Adobe Photoshop or Gimp.

Importing graphics

Inserting

To import graphic files into your drawing, go to Insert > Picture > From File on the main menu bar or click the From File icon on the Drawing toolbar to open the Insert Picture dialog (Figure 132). Draw contains import filters for the majority of graphic formats. If the file you want to import has a graphic format not covered by the import filters, then it is recommended to use one of the many free graphic conversion programs to convert the file into a format that Draw recognizes.

If you select the Preview option in the Insert picture dialog, a preview of the file is shown in the box on the right-hand side. This makes it much easier to select the file you want and also checks that Draw can import the file format used.

Figure 132: Insert Picture dialog
Embedding

Embedding a graphic into a drawing makes the graphic a permanent part of the drawing. Any changes you make to an embedded graphic will only appear in the drawing; the original graphic file will not be affected.

Embedding happens when you import a graphic into a drawing using the Insert File command, copying and pasting, scanning a graphic, or dragging and dropping.

The main advantage of embedding graphics into your drawing is that the graphic is always available no matter what computer is used to open the drawing.

The main disadvantage of embedding graphics is that it creates large file sizes, which may not be desirable if you have limited capacity for storing computer files. Also, if the original graphic is altered, then your drawing will not have an up to date version each time you open your drawing.

Note
When a raster graphic is embedded into a LibreOffice document or drawing, then the format of that graphic is automatically changed to PNG format.

Linking

Linking a graphic to a drawing does not insert the graphic into the drawing, but a link is created to where the graphic file is located on your computer. Each time the drawing is opened, any linked graphics will be displayed in the drawing.

The main advantage of linking a graphic file to a drawing is if the original graphic file is altered or replaced by a new graphic with the same filename, then the next time you open the drawing, the latest version of the graphic will also open in the drawing.

The main disadvantage of linking graphics is that the link between the drawing and the graphic file must be maintained for linking to work correctly. If you move the drawing to another computer, then any linked files must also be moved to the same computer and the same folder on that computer.

To link a graphic file to your drawing, select the **Link** (or **Insert Link**) option in the Insert Picture dialog (Figure 132) before selecting the file and clicking on the **Open** button.

Note
When a graphic file is linked to a LibreOffice document or drawing, the format of the linked graphic is not changed.

![Edit Links dialog](Figure 133: Edit Links dialog)
Any changes made to a linked graphic within a LibreOffice drawing will apply only to the drawing and will not affect the original graphic file that has been linked to the drawing.

Links can be updated, modified, or broken as follows:

1) Go to *Edit > Links* on the main menu bar to open the *Edit Links* dialog (Figure 133).
2) Select the link to be edited.
3) Click on *Update, Modify* or *Break Link*, as appropriate.
   - *Update* – updates the selected link so that the most recently saved version of the linked file is displayed in the current document.
   - *Modify* – changes the source file for the selected link.
   - *Break Link* – breaks the link between the source file and the current document. The most recently updated contents of the source file are kept in the current document.
4) Click *Close* to close the dialog when you have finished editing the link.

**Note**
If you click *Break Link*, then the linked graphic becomes embedded in your drawing and the graphic format is converted to PNG.

**Scanning**

With most scanners you can directly insert a scanned image into a drawing or document. Scanned images are embedded using PNG format.

Make sure that your scanner is configured for the computer and supported by the SANE system for a Linux operating system, or TWAIN for a Windows or Mac operating system.

To insert an image from the scanner:

1) Place a document, drawing, or photograph in the scanner and make sure that the scanner is ready.
2) If this is the first time the scanner has been used, go to *Insert > Picture > Scan > Select Source* on the main menu bar to select the scanner. If the scanner has been used before, go to *Insert > Picture > Scan > Request* on the main menu bar.

**Note**
If there is more than one scanning device connected to the computer, you will be able to select the device when you select the source. This selection will then become the default source when using scan requests until another device is used as the scanning source.

3) The rest of the procedure depends on the scanner driver, interface, and computer operating system. You will normally be required to specify scanning options such as resolution, scan window, and so on. Consult the documentation that came with the scanner for more information.
4) When the image has been scanned, Draw places it in the drawing. At this point it can be edited like any other graphic.

**Copying and pasting**

Copying a graphic and then pasting the graphic into another drawing is another way of embedding graphics into a drawing (this is also called using the clipboard). The copied graphic can be an image already embedded in another document or drawing, or it can be a graphic file such as a drawing, document or photograph.
After copying you can also choose the format when you paste a graphic into Draw using Edit > Paste Special on the main menu bar. Available formats will depend on the type of image copied onto the clipboard.

**Dragging and dropping**

Dragging and dropping is another method of embedding graphics into a drawing and can be used on graphics that have been embedded or linked. The way that dragging and dropping works is determined by the computer operating system. Behavior of dragging and dropping is normally controlled using the Ctrl or Ctrl+Shift keys in combination with the mouse.

Objects and images which are used frequently can be stored in the Draw Gallery. From the Gallery, a copy of the object or image can be simply dragged onto the drawing. Working with the Gallery is dealt with in *Chapter 10 Advanced Draw Techniques*.

**File inserting**

The command Insert > File on the main menu bar allows you to insert from an existing Draw drawing (*.ODG), an Impress presentation (*.ODP), a Writer document (*.ODT), or a document in Rich Text Format (RTF), HTML format, or plain text. Any text file will be contained within a text frame with paragraph and character formatting options available. When inserting a file, normally the complete file will be inserted into your drawing.

However, when selecting a Draw or Impress file, you can also select individual slides or individual objects for insertion into your drawing.

After selecting a Draw or Impress file and clicking on Insert, the Insert Slides/Objects dialog (Figure 134) opens. To access individual slides or objects, click on the expansion symbol (usually a + or a small triangle, depending operating system) to the left of the file name in the selection area.

![Figure 134: Insert Slides/Objects dialog](image)

Select the slides or objects you want to insert and click OK to insert the selected items into your drawing.

If the inserted object was named in the source document, it keeps its original name unless the name already exists in the current document. If there is a name clash, you must give the object a new name before it is inserted. To rename an inserted object, right-click and choose Name from the context menu. Renaming has the advantage that the object is then listed in the Navigator.
Exporting graphics

Exporting the entire file

By default Draw saves drawings in the *.ODG format. Some software programs cannot open these files. To make your drawings available for other programs, you can export the file in various formats.

Figure 135: Exporting graphics

1) Select your file and go to File > Export on the main menu bar.
2) Select the required format from the File type list (Figure 135).
3) Click Export.
4) Depending on the format selected, another dialog will open allowing you to select the required options for the selected graphic format.
5) Click on Export, Create, or OK and your file will be exported as a new file in its new format.

Note

The format options in the File type list (EMF, HTML, XHTML, PDF, and SWF) only apply to complete files.
Exporting objects

To export individual objects from your drawing:

1) Select the objects and then go to File > Export on the main menu bar.
2) Select the required graphic format from the File type list.
3) Select the Selection option on the Export dialog (Figure 135).
4) Click Export.
5) Depending on the graphic format selected, another dialog will open allowing you to select the required options for that graphic format.
6) Click on Export, Create, or OK and your selected objects will be exported as a new file in its new format.

Formatting raster objects

Objects that are raster graphics can be formatted using the Format or context menus. The Picture toolbar is used to add or change filters and adjust the properties of lines, areas, and shadows.

The Transparency property in the Format menu does not relate to the transparency of the raster graphic itself but to the background area. To change the transparency of a raster graphic, you must use the Picture toolbar; see “Picture toolbar” below.

Some raster graphics may have a text element; for more information on formatting text, see Chapter 9 Adding and Formatting Text.

You can change position and size or rotate rotate raster graphics; for more information, see Chapter 3 Working with Objects and Object Points. Raster graphics can also be flipped (Modify > Flip on the main menu bar), but some metafile graphic formats may have problems flipping if they contain text.

Raster graphics included in a group behave like other objects when the properties of the group are modified.

It is recommended to name raster graphics using Modify > Name on the main menu bar or right-click and select Name on the context menu. Only named objects are visible in the Navigator and only named objects can be directly imported from another file.

Picture toolbar

The Picture toolbar will automatically appears when you select a picture (Figure 136). This can be in the main toolbar or as a floating toolbar. The tools available from left to right on the Picture toolbar are as follows:

- Filter – opens the Graphic Filter toolbar which is described in “Graphic filter toolbar” on page 116.
- Graphics mode – changes the display of the graphic from color to grayscale, black and white, or a watermark. This setting affects only the display and printing of the picture; the original picture file remains unchanged.
  - Default – the graphic is displayed unaltered in color.
  - Grayscale – the graphic is displayed in 256 shades of gray.
  - Black/White – the graphic is displayed in black and white.
  - Watermark – the brightness and contrast of the graphic are reduced to the extent that the graphic can be used as a watermark (background).
• **Color** – opens the Color toolbar (Figure 137) to adjust the values of the RGB colors, brightness, contrast, and Gamma. These adjustments do not affect the original picture, but the values are stored in Draw as a separate formatting set.
  - *Red, Green, Blue* – select values between −100% (no color) to +100% (full intensity); 0% represents the original color value of the graphic.
  - *Brightness* – select a value between −100% (totally black) and +100% (totally white).
  - *Contrast* – select a value between −100% (minimum) and +100% (maximum).
  - *Gamma* – this affects the brightness of the middle color tones. Select a value between 0.10 (minimum) to 10 (maximum) Try adjusting this value if changing brightness or contrast does not give you the required result.

• **Transparency** – adjust the degree of transparency of the picture between 0% (opaque) and 100% (fully transparent).

• **Line** – opens the Line dialog. In this context, line refers to the outline of the border. See Chapter 4 Changing Object Attributes for more information.

• **Area** – opens the Area dialog, where you can edit color, gradient, hatching and fills of the background area that contains the picture — not the picture itself. To see the background, you must set the transparency of the picture to a suitably high value.

• **Shadow** – sets the default shadow effect around the picture.

• **Crop Picture** – crops (trims) a picture. When you click on this tool, crop marks appear around the picture. Drag one or more of these marks to crop the picture to your desired size. For more accurate cropping, see “Cropping” on page 115.
• **Effects** – opens the Mode toolbar. See *Chapter 4 Changing Object Attributes* for more information.

• **Flip** – flips the selected object either horizontally or vertically. See *Chapter 4 Changing Object Attributes* for more information.

• **Position and Size** – opens the Position and Size dialog. See *Chapter 3 Working with Objects and Object Points* for more information.

• **Alignment** – opens the Alignment toolbar where you align an object in relation to other objects in the drawing. See *Chapter 5 Combining Multiple Objects* for more information.

• **Arrange** – opens the Arrange toolbar where you move a selected object either forward or backward in relation to other objects in the drawing. See *Chapter 5 Combining Multiple Objects* for more information.

**Cropping**

For more control and accuracy over cropping functions, select the picture and go to **Format > Crop Picture**, or right-click and select **Crop Picture** from the context menu to open the **Crop** dialog (Figure 138).

Any changes made in the Crop dialog change only the display of the graphic. The original graphic file is not changed. If you want to export a cropped graphic, you must do it through **File > Export**. If you use **Save as Picture** from the context menu, the changes are not exported.

![Crop dialog](image)

*Figure 138: Crop dialog*

**Note**

As an alternative to cropping, the **Position and Size** dialog has an option for keeping the width and height ratio fixed while changing one of the two dimensions. Changing values in one area (**Scale** or **Image Size**) will show up correspondingly in the other area.

**Note**

Take care with cropping operations. In the **Crop** dialog, the width and height are treated as independent values. Changing one without the other can result in significant distortion of the image and this may not be what you want.
**Crop**

Use this section of the Crop dialog to trim or scale the selected graphic, or to add white space around the graphic.

- **Keep scale** – maintains the original scale of the graphic when cropping so that only the size of the graphic changes.
- **Keep image size** – maintains the original size of the graphic when you crop so that only the scale of the graphic changes. To reduce the scale of the graphic, select this option and enter negative values in the cropping boxes. To increase the scale of the graphic, enter positive values in the cropping boxes.
- **Left** and **Right** – if Keep Scale is selected, enter a positive amount to trim the left or right edge of the graphic, or a negative amount to add white space to the left or right of the graphic. If Keep image size is selected, enter a positive amount to increase the horizontal scale of the graphic, or a negative amount to decrease the horizontal scale of the graphic.
- **Top** and **Bottom** – if Keep Scale is selected, enter a positive amount to trim the top or bottom of the graphic, or a negative amount to add white space above or below the graphic. If Keep image size is selected, enter a positive amount to increase the vertical scale of the graphic, or a negative amount to decrease the vertical scale of the graphic.

**Scale**

Use this section of the Crop dialog to change the scale of the selected graphic. In the **Width** and **Height** fields enter a value for the width or height of the selected graphic as a percentage.

**Image size**

Use this section of the Crop dialog to change the size of the selected graphic. In the **Width** and **Height** fields enter a value for the width or height of the selected graphic.

Above the **Original Size** button, the original size of the graphic is displayed. Clicking on this button and then clicking **OK** resets the inserted image to the original image size.

**Graphic filter toolbar**

After selecting a graphic and the Picture toolbar (Figure 136) has opened, click on the Filter icon to open the Graphic Filter toolbar (Figure 139). Draw offers eleven filter effects. Filters work on the current view of a graphic and they can be combined. Filters always apply to the entire graphic; it is not possible to use filters to edit only a part of the object.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>
| If your graphic is linked, any graphic filters used are only applied to the current view. The original graphic is not changed. When you close the drawing, any filtering applied is lost. To keep a copy of the filtered graphic, export the graphic to create a copy with all the filters applied (File > Export).

If your graphic is embedded, all graphic filters are applied directly on the embedded graphic and cannot be undone in a subsequent session. After you save and close the drawing, the graphic filter effects become permanent. If you do not want to retain a graphic filter, you must use Edit > Undo to cancel the filter effect before saving the file. |
Invert graphic filter

Clicking on the Invert icon inverts or reverses the color values of a color image (similar to a color negative), or the brightness values of a grayscale image. Apply the filter again to revert to the original graphic (Figure 140).

Smooth graphic filter

Clicking on the Smooth icon softens or blurs the image by applying a low pass filter reducing the contrast between neighboring pixels and produces a slight lack of sharpness (Figure 141). The Smooth icon also opens the Smooth dialog (Figure 142), where you can set the Smooth Radius parameter fused for the Smooth filter when you click OK.
Figure 142: Smooth dialog

**Sharpen graphic filter**

Clicking on the **Sharpen** icon sharpens the image by applying a high pass filter, increasing the contrast between neighboring pixels emphasizing the difference in brightness. This will accentuate the outlines and the effect will be strengthened if you apply the filter several times (Figure 143).

![Normal vs. Sharpened](image)

*Figure 143: Sharpen graphic filter*

**Remove noise graphic filter**

Clicking on the **Remove Noise** icon removes noise by applying a median filter by comparing every pixel with its neighbors. It then replaces extreme values of those pixels that deviate in color by a large amount from a mean value by a pixel with a mean color value. The amount of picture information does not increase, but because there are fewer contrast changes resulting in a graphic that looks smoother (Figure 144).

![Noise vs. Noise removed](image)

*Figure 144: Remove Noise graphic filter*

**Solarization graphic filter**

Solarization is a phenomenon in photography in which the image recorded on a negative or on a photographic print is wholly or partially reversed in tone. Dark areas appear light or light areas appear dark. Solarization was originally a photochemical effect used during photographic film development and is now used in the digital world of computing to create a change or reversal of color (Figure 145 and Figure 146).
Clicking on the Solarization icon opens the Solarization dialog, where you can define the threshold value for solarization. Entering a Threshold value above 70% reverses the color values (center picture in Figure 145). Selecting the Invert option causes all the colors to be inverted (right picture in Figure 145).

Aging graphic filter

Aging creates a look that resembles photographs developed in the early days of photography. All pixels are set to their gray values and then the green and blue color channels are reduced by the amount specified in the Aging dialog. Red color channel is not changed (Figure 147 and Figure 148). Clicking on the Aging icon opens the Aging dialog (Figure 148), where you can define the Aging degree and create an old look for your graphic as shown in the right picture in Figure 147.
Posterize graphic filter

Posterizing reduces the number of colors in a graphic making it look flatter. When used on a photograph, posterizing can make the photograph look like a painting. Clicking on the Posterize icon opens the Posterize dialog, where you can define the number of Poster colors to produce the effect you want (Figure 149 and Figure 150).

![Figure 149: Posterize graphic filter](image)

![Figure 150: Posterize dialog](image)

![Figure 151: Pop Art graphic filter](image)
Pop art graphic filter
Click on the Pop Art icon to change the colors of a graphic to a pop-art format (Figure 151).

Charcoal sketch graphic filter
Click on the Charcoal Sketch icon to display the graphic as a charcoal sketch. The contours of the graphic are drawn in black and the original colors are suppressed (Figure 152).

![Normal and Charcoal Sketch](image)

*Figure 152: Charcoal Sketch graphic filter*

Relief graphic filter
The Relief graphic filter calculates the edges of a graphic in relief as if the graphic is illuminated by a light source. Clicking on the Relief icon opens the Relief dialog, where you can select the position of the Light source producing shadows that differ in direction and magnitude (Figure 153 and Figure 154).

![Normal and Relief](image)

*Figure 153: Relief graphic filter*

![Relief dialog](image)

*Figure 154: Relief dialog*
Mosaic graphic filter

The Mosaic graphic filter joins groups of pixels and converts them into a rectangular tile in a single color creating a graphic that appears to be a mosaic. The larger the individual rectangles created, the fewer details the mosaic graphic has.

Clicking on the Mosaic icon opens the Mosaic dialog, where you can set the number of pixels used to create the Width and Height of each tile created. Selecting Enhanced edges will enhance the edges of each tile to create a sharper definition (Figure 155 and Figure 156).

![Mosaic graphic filter](image)

**Figure 155: Mosaic graphic filter**

![Mosaic dialog](image)

**Figure 156: Mosaic dialog**

Replacing colors

The Color Replacer allows you to replace or change a color in a graphic for another color or set the color as transparent. Up to four colors can be replaced at once. The tool works on the entire graphic and you cannot select an area of the graphic for editing.

The Color Replacer can only be used on embedded graphics. If you try to use the Color Replacer on a linked graphic, you will get the following error message: This graphic is linked to a document. Do you want to unlink the graphic in order to edit it?

The selection list for replacement colors shows all the available colors in the current color palette of the drawing. You cannot define any new colors here but you can add colors to the available palette before using the Replace Color tool. For more information on this topic, see Chapter 10 Advanced Draw Techniques.

Replacing colors

To replace a color in a graphic, do as follows:

1) Go to Tools > Color Replacer on the main menu bar to open the Color Replacer (Figure 157).

2) Select a graphic to start using the Color Replacer.
3) Click on the Pipette icon to activate the color selection mode.
4) Move the cursor over the color you want to replace in the selected graphic and click on the color to be replaced.
5) A check box is now marked and the selected color appears in Source color.
6) Enter the amount of tolerance required for replacing the color in the Tolerance box. The default selection is 10% tolerance.
7) In Replace with, select a color from the drop-down list. Transparent is the default selection.
8) After selecting up to four colors for replacement, click Replace to replace the colors in the selected graphic.
9) There is no preview of the effect. If the result is not what you required, select Edit > Undo in the main menu bar and repeat the color replacement.

Replacing transparent areas

It is also possible to replace transparent areas in a graphic with a color.

1) Go to Tools > Color Replacer on the main menu bar to open the Color Replacer (Figure 157).
2) Make sure the graphic is NOT selected.
3) Select Transparency in the Color Replacer.
4) Select a color from the drop-down list next to Transparency.
5) Click Replace to replace the transparent areas with the selected color.

Tolerance parameter

The Tolerance parameter is used to set how much of the source color in the graphic is replaced by another color. To replace colors that are similar to the color you are replacing, enter a low value for the tolerance parameter. To replace a wider range of colors, enter a higher value for the tolerance parameter.

Conversion

Convert to a contour

Converts a selected graphic to a contour by creating a polygon, or a group of polygons.
1) Select the graphic in your drawing.
2) Go to Modify > Convert > To Contour, or right-click on the graphic and select Convert > To Contour.
If the conversion creates a group of polygons (for example a text object), then **Modify > Enter Group**, or right-click on the converted graphic and select **Enter Group** from the context menu, or press the **F3** key to enter the group before selecting an individual polygon.

**Note**
Make sure you have finished all your editing to your graphic before converting to a contour as the graphic cannot be edited after conversion.

**Convert to a polygon**

Converts a selected graphic to a collection of polygons filled with color. The graphic also becomes a vector graphic and can be resized with no loss of image quality or distortion of any text. After conversion, you can break the graphic into groups of polygons and then split these groups into individual polygons. Breaking and splitting allows you to edit or delete individual colors within the graphic.

![Figure 158: Convert to Polygon dialog](image)

**Converting**

To convert a graphic to a polygon:

1) Select the graphic in your drawing.

2) Go to **Modify > Convert > To Polygon**, on the main menu bar, or right-click on the graphic and select **Convert > To Polygon** to open the Convert to Polygon dialog (Figure 158).

3) Select the **Number of colors** and **Point reduction** to be used in the conversion.

4) To prevent any blank areas appearing in your graphic, select **Fill holes** and the number of pixels to use for the **Tile size**.

5) Click **Preview** to check how your converted graphic will look.

6) Make any necessary changes to the settings and check the preview again.

7) If you are satisfied, click **OK** to convert your graphic to a polygon.
Conversion options and controls

- **Number of colors** – enter the number of colors to be displayed in the converted image. LibreOffice generates a polygon for each occurrence of a color in the image. The range for the number of colors is between 8 and 32.
- **Point reduction** – removes color polygons that are smaller than the pixel value you enter. The range for point reduction is between 0 and 32 pixels.
- **Fill holes** – fills the blank areas in the graphic that can be created when applying a point reduction.
- **Tile size** – enter the size of the rectangle for the background fill. The range of tile sizes is between 8 and 128 pixels.
- **Source picture** – preview of the original image.
- **Vectorized image** – preview of the converted image. Click Preview to generate the vectorized image.
- **Progress** – displays a progress bar during conversion.
- **Preview** – creates a preview of the converted image without applying any changes.
- **OK** – converts your graphic to polygons.

Breaking

After converting a graphic to polygons, you can break the graphic into groups of polygons. Each group of polygons consists of one color.

1) Convert your graphic to polygons, see “Converting” above.
2) Make sure your graphic is selected and go to Modify > Break on the main menu bar, or right-click on your graphic and select Break from the context menu to break your converted graphic into groups of polygons.
3) Click on a color in your graphic then drag the group of polygons filled with that color out of your graphic to create a new graphic OR press the Delete key and delete the color from your graphic.

Splitting

After converting a graphic to polygons and breaking the graphic into groups of polygons, you can then split these groups into individual polygons.

1) Convert your graphic to polygons, see “Converting” above.
2) Break your graphic into groups of polygons, see “Breaking” above.
3) Make sure your graphic is selected and go to Modify > Split on the main menu bar, right-click on the graphic and select Split from the context menu, or use the keyboard combination Ctrl+Alt+Shift+K to split groups of polygons into individual polygons.
4) Click on an individual polygon in your graphic and drag it out of your graphic or a polygon group OR press the Delete key and delete the polygon from your graphic.

Convert to a bitmap

All drawing objects placed into a LibreOffice drawing are vector graphics and these vector graphics can be converted to a bitmap in PNG format. Any transparency effects in the original vector graphic are lost during conversion even though the PNG format used does support transparencies.

To convert a vector graphic to a bitmap, go to Modify > Convert > To Bitmap on the main menu bar or right-click on the graphic and select Convert > To Bitmap from the context menu.
Print options

If you have only a monochrome (single color) printer or are experiencing problems with printing, then the following settings may help with printing your drawing. You can set up printing so that all text and all graphics are printed either in grayscale or black and white.

The general settings are in Tools > Options > LibreOffice Draw > Print (Figure 159) and will apply to all drawings that you print using LibreOffice Draw.

![Figure 159: Options - LibreOffice Draw - Print](image)

To set printing options for the current document only, go to File > Print or use the keyboard combination Ctrl+P and click on the Options tab in the Print dialog (Figure 160).

![Figure 160: Print dialog -- Options](image)

To set printing options for all the modules in LibreOffice, go to Tools > Options > LibreOffice > Print (Figure 161). These printing options allow you to reduce print data sent to a printer or file, and to give any printer warnings if the wrong paper size or orientation and transparency is set.
Figure 161: Options - LibreOffice - Print
Chapter 7
Working with 3D Objects
Introduction

Although Draw does not match the functionality of leading drawing or picture editing programs, it is capable of producing and editing 3D drawings and pictures. 3D objects can be created using one of the following methods:

- Extrusion – creates a 3D shape.
- Rotation – creates a 3D scene.
- Conversion – creates a 3D scene.
- Ready-made 3D objects which are 3D scenes.

3D object types

3D shapes

A 3D shape is created when a 2D object or text from the Fontwork Gallery is turned into 3D using extrusion with the Extrusion On/Off icon on the Drawing or 3D-Settings toolbars. The Status bar displays Shape selected when this type of 3D object is selected.

A 3D shape can be viewed and edited in 2D mode by clicking on the Extrusion On/Off icon. To switch back to 3D mode, click the Extrusion On/Off icon again.

Any changes you want to make to the 3D effects used for a 3D shape are carried out using the 3D-Settings toolbar.

Note: The Extrusion On/Off icon only becomes available for use when you select a 2D object, or a 3D object that has been extruded from a 2D object.

3D scenes

3D scenes are built from objects which have dimensions using x, y, and z coordinates. The Status bar displays 3D scene selected when a 3D object is selected that has been created from a 2D object using body rotation or conversion, or it is a ready-made 3D object that has been inserted into your drawing.

When you create a 3D scene from a selection of more than one 2D object, a group is automatically created. You can enter this 3D scene group so that you change the 3D effects and rotate the individual 3D objects within the group.

To enter the group, go to Modify > Enter Group on the main menu bar, or press the F3 key, or right-click on the group and select Enter Group from the context menu.

To exit the group after you have finished your changes, go to Modify > Exit Group on the main menu bar, or use the Ctrl+F3 key combination, or right-click on the group and select Exit Group from the context menu.

Note: You cannot ungroup into individual objects a 3D scene group that has been created from a selection of 2D objects.
Creating

Drawing toolbar
Before you begin creating 3D objects in your drawing, it is recommended that you add the LibreOffice 3D tools to the Drawing toolbar as follows:

1) Right-click in an empty area on the Drawing toolbar and select Visible Buttons from the context menu.

2) Select To 3D 🥜 and To 3D Rotation Object 🚂 from the available list of icons to place them on the Drawing toolbar as shown in Figure 162.

![Drawing toolbar]

Figure 162: Drawing toolbar

**Note**
The To 3D, To 3D Rotation Object, and Extrusion On/Off icons only become active when a 2D object is selected in your drawing.

Extrusion

*Extrusion* is a procedure that creates a 3D shape from a 2D object. The 3D geometry is formed by extruding a polygon perpendicular to the plane of the given polygon using depth to create front, back, and side faces. The side faces are formed by connecting all corresponding single edges of the front and back faces.

Draw uses a default value for extrusion (depth) based on the size of a 2D object. This value can be changed after carrying out extrusion; see “3D-Settings toolbar” on page 137 for more information.

1) Draw an object using one of the shape tools on the Drawing toolbar.
2) Select the 2D object you want to convert to 3D.

**Note**
Extrusion only works on basic shapes, symbol shapes, block arrows, flowcharts, callouts, and stars that are included as a part of the default set of tools on the Drawing toolbar. Extrusion can also be used on any text created using the Fontwork Gallery.

![Extruding a 3D object from a 2D object]

Figure 163: Extruding a 3D object from a 2D object
3) Click the **Extrusion On/Off** icon on the Drawing toolbar and the selected 2D object is converted into a 3D shape (Figure 163). The **Extrusion On/Off** icon used to create 3D shapes from 2D objects is included in the default set of tools for the Drawing toolbar.

4) Alternatively, click on the **Extrusion On/Off** icon on the 3D-Settings toolbar and the selected 2D object is converted into a 3D shape. If the 3D-Settings toolbar is not visible, go to **View > Toolbars > 3D-Settings** on the main menu bar.

**Rotation**

**To 3D rotation**

To **3D rotation** converts a 2D object into a 3D scene by rotating the object using the left edge of the bounding box around the object as the axis of rotation. Examples of rotation are shown in Figure 164, where a thick line has been used as an example object. The actual 3D shape created also depends on the angle and shape of the object being rotated.

1) Draw a line and make sure it is selected.

2) To convert the line into a 3D scene, click on the **To 3D Rotation Object** icon on the Drawing toolbar, or go to **Modify > Convert > To 3D Rotation Object** on the main menu bar, or right-click on and select **Convert > To 3D Rotation Object** from the context menu.

![Normal line, Curved line, Freeform line](image)

*Figure 164: Examples of using To 3D body rotation*

**In 3D rotation**

**In 3D rotation** converts a 2D object into a 3D scene by rotating the object using a movable axis of rotation. A 2D object is rotated and slightly tilted with the central projection turned on so that the converted object is better recognized as a 3D scene (Figure 165).

![Examples of rotating 2D objects to create a 3D objects](image)

*Figure 165: Examples of rotating 2D objects to create a 3D objects*

The default location of this rotation axis is the left edge of the bounding box around the object. However, this location and angle of rotation can be adjusted, allowing you to create 3D scenes that have different shapes. Examples of adjusting the rotation location and angle are shown in Figure 166 where a thick line has been used as an example object. The actual 3D scene created also depends on the angle and shape of the object being rotated.

1) Draw a line and make sure it is selected.

2) Click on the small triangle next to the **Effects** icon on the Line and Filling toolbar and select the **In 3D Rotation Object** icon in the popup toolbar.
3) Alternatively, go to View > Toolbars > Mode on the main menu bar to open the Mode toolbar and select the In 3D Rotation Object icon.

4) If necessary, adjust the position and angle of the rotation axis. This is shown as a dashed line with rotation points at each end.

5) Click anywhere outside the object and it is converted into a 3D scene.

---

**Note**

The shape of the Effects icon on the Line and Filling toolbar changes depending on the last Effects tool that was used on the Line and Filling or Mode toolbars. If the Effects icon is not visible on the Line and Filling toolbar, then right-click in an empty area on the toolbar and click on Visible Buttons, then select Effects.

---

**Conversion**

When a 2D object is converted to a 3D scene, it is slightly tilted and central projection turned on so that the converted object is better recognized as a 3D scene.

1) Select a 2D object in your drawing.

2) Go to Modify > Convert > To 3D or To 3D Rotation object on the main menu bar and the object is converted into a 3D scene.

3) Alternatively, right-click on the object and select Convert > To 3D or To 3D Rotation object from the context menu and the object is converted into a 3D scene.

Examples of conversion using To 3D are shown in Figure 165 on page 132 and for To 3D Rotation object conversion; see “To 3D rotation" on page 132 for more information.
Text and Fontwork

Text
Draw treats text like an object which can be converted to 3D as easily as any other object in your drawing.

1) Click on the Text icon on the Drawing toolbar.
2) Move the cursor onto your drawing and click once to create a text box, then type your text.
3) Click again on the text box to select it. Selection handles will show on the text box.
4) Click the To 3D icon on the Drawing toolbar, or go to Modify > Convert > To 3D or To 3D Rotation object, or right-click on the object and select Convert > To 3D or To 3D Rotation object from the context menu and the selected text is converted into a 3D scene.
5) See “Editing 3D objects” on page 135 on how to change the 3D effects for 3D text.

Fontwork
The Fontwork Gallery in Draw contains a set of templates allowing you to create artistic text for your drawings. Click on the Fontwork icon on the Drawing toolbar to open the Fontwork Gallery (Figure 167). See the Impress Guide Chapter 5 Managing Graphic Objects for more information on the Fontwork Gallery and its tools.

After creating your text using the Fontwork Gallery, it can be converted to a 3D shape using the information in “Extrusion” on page 131, and into a 3D scene using “Rotation” on page 132, “Conversion” on page 133, or “Text” above.

Figure 167: Fontwork Gallery
**Ready-made 3D objects**

LibreOffice has a collection of ready-made 3D objects available for immediate use. To access these ready-made 3D objects, go to View > Toolbars > 3D Objects on the main menu bar to open the 3D-Objects toolbar or click on the 3D Objects icon on the Drawing toolbar to open a pop-up menu (Figure 168).

Creating 3D scenes using this toolbar is exactly the same as drawing basic shapes. See Chapter 2 Drawing Basic Shapes for more information.

![Figure 168: 3D Objects toolbar](image)

**Note**

The shape of the 3D Objects icon on the Drawing toolbar changes depending on the last tool that was used.

If the 3D Objects icon is not visible on the Drawing toolbar, then right-click in an empty area on the toolbar and click on Visible Buttons and select 3D Objects.

**Editing 3D objects**

**Note**

Where 3D scenes have been created from more than one 2D object, a 3D scene group is automatically created. You cannot ungroup this 3D scene group and any editing carried out will affect all 3D objects within the group. To edit an individual 3D object within this 3D scene group, you must enter the group. See “3D scenes” on page 130 for information.

**Rotation**

Rotating 3D scenes and shapes is similar to rotation for 2D objects (see Chapter 3 Working with Objects and Object Points for more information).

**Using the mouse**

**Note**

For 3D shapes that have been created using extrusion, see “3D-Settings toolbar” on page 137 for information on how to rotate 3D shapes about the horizontal or vertical axes.

1) Select a 3D object (3D scene or 3D shape), then click on the small triangle next to the Effects icon on the Line and Filling toolbar and select the Rotate icon in the pop-up toolbar, or go to View > Toolbars > Mode on the main menu bar to open the Mode toolbar and select the Rotate icon or go to Modify > Rotate on the main menu bar.

2) Click on a corner selection handle and hold the mouse button down until the cursor changes to a double-headed circular arrow.

3) Drag the cursor to rotate the 3D object around the rotation point in exactly the same way as rotating a 2D object.

4) Release the mouse button when you are satisfied with the rotation effect.
5) Click on a center selection handle and hold the mouse button down until the cursor changes to parallel arrows. These center selection handles are not available for 3D shapes created using the extrusion method.

6) Drag the cursor to rotate the 3D object around the horizontal axis or the vertical axis. The left and right center selection handles are used for the horizontal axis. The top and bottom center selection handles are used for the vertical axis.

7) Release the mouse button when you are satisfied with the rotation effect.

By default, the rotation point is in the center of a selected 3D object. This rotation point can be moved to change the center of rotation and create a different effect when you carry out rotation. Move your cursor over the rotation point until it changes (normally a pointed fist), then click and drag the rotation point to a new position. Alternatively, click and drag on the 3D object to a new position when it is in rotation mode to move the object away from the default position for the center of rotation.

**Using the Rotation dialog**

1) Select the 3D object (3D scene or 3D shape).

2) Go to `Format > Position and Size` on the main menu bar, or right-click on the selected object and select `Position and Size` from the context menu, or press the F4 key to open the Position and Size dialog (Figure 169).

3) Click on the **Rotation** tab to open the Rotation page.

4) In the **Rotation angle** section, enter the number of degrees for rotation in the **Angle** box.

5) Alternatively, click and drag the **Rotation Angle** indicator in **Default settings** until you reach the rotation angle you require. As you drag the indicator, the rotation angle is displayed in the **Angle** box.

6) In the **Pivot point** section, enter the X and Y coordinates in the **Position X** and **Position Y** boxes to adjust the location of the rotation point.

7) Alternatively, select one of the position points in **Default settings** to adjust the location of the rotation point. The default location is in the center.

8) Click **OK** to save your changes and close the dialog.
3D-Settings toolbar

The 3D-Settings toolbar (Figure 170) is only used to edit a 3D shape that has been created from a 2D object using extrusion (see “Extrusion” on page 131 for more information). To open the 3D-Settings toolbar, go to View > Toolbars > 3D-Settings on the main menu bar. The 3D-Settings toolbar only becomes active when a 3D shape has been selected.

![3D-Settings toolbar](image)

Figure 170: 3D-Settings toolbar

The tools available for editing 3D shapes are as follows. The result of any changes made using these editing tools is applied to the selected 3D shape immediately and the 3D effect is displayed.

- **Extrusion On/Off** – used to create a 3D shape from a 2D object. If necessary, can also be used to switch off the 3D effects created by extrusion allowing you to edit the underlying 2D object.

- **Tilt Down** – tilts the selected object downward (horizontal axis rotation) by 5 degrees each time the icon is used.

- **Tilt Up** – tilts the selected object upward (horizontal axis rotation) by 5 degrees each time the icon is used.

- **Tilt Left** – tilts the selected object left (vertical axis rotation) by 5 degrees each time the icon is used.

- **Tilt Right** – tilts the selected object right (vertical axis rotation) by 5 degrees each time the icon is used.

- **Depth** – opens a pop-up menu where you can set the extrusion depth from an object by a fixed or custom amount.

- **Direction** – opens a pop-up menu where you can set the view direction to create an extrusion in either a perspective or parallel projection.

- **Lighting** – opens a pop-up menu where you can set the direction and intensity of the lighting when creating an extrusion.

- **Surface** – opens a pop-up menu where you can set the surface of the extrusion as matt, plastic, metal, or wireframe display.

- **3D Color** – opens a pop-up menu where you can set the color used for the extrusion. This color does not have to be the same as the color used for the original 2D object.
3D effects

The 3D Effects dialog (Figure 171) offers a wide range of possible settings for 3D objects created using the following methods. This dialog can also be used to convert a 2D object to 3D using the tools in the bottom left corner of the dialog.

To open the 3D Effects dialog, select the 3D object and right-click on the object then select 3D Effects from the context menu to open the 3D Effects dialog.

Any 3D effects that you apply to a 3D scene are not carried out until you click on the Assign icon. This allows you to make all the 3D effect changes before applying them to your 3D scene.

Figure 171: 3D Effects dialog - Geometry

Note

You can add a 3D Effects icon to the Drawing toolbar, or any other toolbar, by going to View > Toolbars > Customize or right-clicking in an empty area on the toolbar and selecting Customize Toolbar. When the Customize dialog opens, go to Toolbars, select the toolbar you want to use and click on the Add button to display the Add Commands dialog. The 3D Effects icon is located in the Options category.

3D conversion

In the bottom left corner of all the pages in the Effects dialog are tools allowing you to convert a 2D object to a 3D object and to change the projection used in a 3D object.

- Convert to 3D – converts the selected object into a 3D scene. This tool works in the same way as “Conversion” on page 133.

- Convert to Lathe Object – converts a 2D object into a 3D scene using body rotation. This tool works in the same way as “To 3D rotation” on page 132.
• **Perspective On/Off** – switches perspective projection on or off for a 3D object. Perspective projection is where projecting lines from the center of projection pass through an imaginary plane until they meet at a point some distance from an object.

### 3D Effects - Geometry

On the **Geometry** page of the Effects dialog (Figure 171) you can make changes to the geometry of a 3D object.

- **Geometry** – defines the properties for a 3D scene or shape created from a 2D object.
  - **Rounded edges** – enter the amount by which you want to round the corners of a 3D shape as shown by the example in Figure 172. The default setting for rounded edges is 10%.

![Figure 172: Rounded edges example](image)

- **Scaled depth** – enter the amount by which to increase or decrease the frontal area of the selected 3D object. Figure 173 shows an example where the scaled depth has been increased to 150% and then decreased to 50%. The default setting for scaled depth is 100%.

![Figure 173: Scaled depth example](image)

- **Rotation angle** – enter the angle in degrees to rotate a 2D object that has been converted to 3D using the **To 3D Rotation Object** tool. Figure 174 shows an example of a 2D circle converted to 3D and the rotation angle changed to 150 degrees.
Figure 174: Rotation angle example

- **Depth** – enter the extrusion depth for the selected 3D object. This option is not available for 2D rotation objects converted to 3D using the **To 3D Rotation Object** tool. Figure 175 shows an example of a 2D circle converted to a 3D cylinder with the extrusion depth increased to 3 cm.

Figure 175: Depth example

- **Segments** – changes the number of segments that Draw uses to draw a 3D rotation object. The higher the number of segments, the smoother the object surface will be. However, a high segment number may increase the time it takes to generate the 3D object on your display. Figure 176 shows the difference on a 3D sphere when the segments have been increased from 10 to 30 segments horizontally and vertically.

  - **Horizontal** – enter the number of horizontal segments to use in the selected 3D rotation object.
  - **Vertical** – enter the number of vertical segments to use in the selected 3D rotation object.

Figure 176: Segment example
• **Normals** – modifies the rendering style of the 3D surface (Figure 177 and Figure 178).
  
  - **Object-Specific** – renders the 3D surface according to the shape of the object. For example, a circular shape is rendered with a spherical surface.
  
  - **Flat** – renders the 3D surface as polygons.
  
  - **Spherical** – renders a smooth 3D surface regardless of the shape of the object.

![Object-Specific, Flat, and Spherical examples](image)

*Figure 177: Object-Specific, Flat, and Spherical examples*

- **Invert Normals** – inverts or reverses which side of the selected object is considered to be the outside face and which side is considered the inside face.

- **Double-Sided Illumination** – lights an object from the outside and the inside of the object. To use as an ambient light source, click this button, and then click *Invert Normals*. This is a setting for the whole of the 3D scene and not for a single object within the scene.

- **Double-Sided** – a 3D object has a front and back face. With *Double-Sided* switched off, only the front face of the object is rendered. The effect, when looking from
outside, is that the object solid, but, when looking from inside, the front face is transparent. If there is no view to the inside face, normally for an extruded 3D object with solid texture, the *Double-Sided* should be switched off to improve performance during rendering. Any 3D object created using rotation often allow an inside view and it is recommended that Double-Sided is switched on. Which side of an object face is considered to be back or front is determined by the *Invert Normals* setting, that is the front side of a plane is the one the normal points away from.

**3D Effects – Shading**

On the Shading page of the Effects dialog (Figure 179) you can set the shading and shadow options for the selected 3D object.

- **Shading** – specifies the type of shading applied to a 3D object (Figure 180).
  - *Flat Mode* – assigns a single color of shading to a single segment on the surface of the object.
  - *Gouraud Mode* – blends shading colors across the segments.
  - *Phong Mode* – averages the shading color of each pixel in a segment based on the pixels that surround it, and requires the most processing power.

![3D Effects dialog - Shading](image)

*Figure 179: 3D Effects dialog - Shading*

![Shading mode examples](image)

*Figure 180: Shading mode examples*
• **Shadow** – adds or removes a shadow from a selected 3D object (Figure 181).
  - 3D Shadowing On/Off – switches the shadowing on or off.
  - Surface angle – enter an angle from 0 to 90 degrees for casting a shadow.

• **Camera** – sets the camera options for a selected 3D scene as if you are actually using a camera to take a photograph (Figure 182).
  - Distance – enter the distance to leave between the camera and the center of the selected 3D scene. The default setting for distance is 2.6cm.
  - Focal length – enter the focal length of the camera lens, where a small value corresponds to a fish-eye lens and a large value to a telephoto lens. The default setting for focal length is 10cm.

**3D Effects – Illumination**

On the Illumination page of the Effects dialog (Figure 183) you define how a 3D scene is lit and the settings apply to all 3D objects in a scene. You can specify the direction of the light source for the 3D scene, as well as the color of the light source and of the ambient light.

By default one light source is already selected when you open the Illumination page. However, you can select another light source or use more than one light source for illumination. A maximum of eight sources can be used and each light source can use a different color. Figure 183 shows three light sources selected with each color having a different color. At least one light source must be active; otherwise, the rendering and shading functions on 3D Effects will not function correctly.

1) Select a **Light source** icon to turn the required light source on. The icon changes to an illuminated bulb.

2) Press the space bar or click again on the selected light source so you can adjust the color and ambient light for the light source.
3) Select a color for the light from the drop-down list for **Light source**. A different color can be used for each light source selected.

4) If necessary, select a color from the drop-down list for **Ambient light** to set the color of the surrounding light.

5) To deselect a light source, select the light source and click on it again.

The light source location and color are shown in the lower right corner of the Illumination page. The vertical slider bar adjusts the lighting angle and the horizontal slider bar rotates the light about the object. Alternatively you can click on the light point and drag the light source to where you want it.

To change the preview from a sphere to a cube, click on the small square to the right of the horizontal slider bar and below the vertical slider bar.

Each light source selected is shown as a small colored sphere in the color specified for it. The larger colored sphere indicates the active light source.

### 3D Effects – Textures

On the Textures page of the Effects dialog (Figure 184) you can set the properties of the surface texture for a selected 3D object. The Textures page is only available after you have set the **Area Fill** of a 3D object to **Gradient**, **Hatching** or **Bitmap**. For more information, see *Chapter 4 Changing Object Attributes*.

- **Type** – sets the color properties of the texture.
  - **Black & White** – converts the texture to black and white.
  - **Color** – converts the texture to color.

- **Mode** – shows or hides shading.
  - **Only Texture** – applies the texture without shading.
  - **Texture and Shading** – applies the texture with shading. To define the shading options for the texture, use the Shading page of this dialog.
Figure 184: 3D Effects - Textures

- **Projection X** – sets the options for displaying the texture along the X axis. Only one of the three following options can be selected.
  - *Object-Specific* – automatically adjusts the texture for best fit based on the shape and size of the object. This is the default setting.
  - *Parallel* – applies the texture parallel to the horizontal axis and is mirrored on the rear side of the object.
  - *Circular* – wraps the horizontal axis of the texture pattern around an object.

- **Projection Y** – sets the options for displaying the texture along the Y axis. Only one of the three following options can be selected.
  - *Object-Specific* – automatically adjusts the texture for best fit based on the shape and size of the object. This is the default setting.
  - *Parallel* – applies the texture parallel to the vertical axis and is mirrored on the rear side of the object.
  - *Circular* – wraps the vertical axis of the texture pattern around an object.

- **Filter** – filters out noise that can occur when you apply a texture to a 3D object.
  - *Filtering On/Off* – blurs the texture slightly to remove unwanted speckles.

Before Textures can be used, you must change the area fill of the 3D object as follows:

1) Select the 3D object.
2) Right-click on the 3D object and select **Area** from the context menu or go to **Format > Area** on the main menu bar to open the **Area** dialog.
3) From the **Fill** drop-down list, select **Gradient, Hatching or Bitmap**.
4) Select the fill from the list that appears and then click **OK**. The texture is then applied to the selected 3D object.
3D Effects - Material

On the Materials page of the Effects dialog (Figure 185) you can change the appearance of a 3D object to represent different materials. Materials and textures can be combined with each other and it is a matter of trial and error to achieve the desired result.

- **Material** – assigns a predefined color scheme or lets you create your own color scheme.
  - *Favorites* – select a predefined color scheme, or select a custom color scheme that has been user defined.
  - *Object color* – select the color that you want to apply to a 3D object.
  - *Illumination color* – select the color to illuminate the object and brightening parts of the object which lie in shadow making the object seem more illuminated.

- **Specular** – sets the light reflection properties for the selected object simulating the reflecting capacity of the surface. The position of the illuminated point is determined by the setting of the first light source.
  - *Color* – select the color that you want the object to reflect.
  - *Intensity* – enter the intensity of the specular effect.

- The **Color** icon opens the **Color** dialog allowing you to define your own colors using the two-dimensional graphic and numerical gradient chart.

**Tip**

Do not use a very high brightness values for individual colors. These are all additive and it is easy to end up with a colored area that is white.

When you use individual color parameters additional effects can be produced, which are similar to the color parameters in “3D Effects – Illumination” on page 143.

**Note**

Metallic and glass surfaces do not simulate well because the appearance of these materials is produced using reflection.
3D-Settings toolbar editing
When 3D shapes have been created from 2D objects using the extrusion method, they are handled differently from 3D scenes. You have to use the tools on the 3D-Settings toolbar to make any changes to a 3D shape. These tools are highlighted in Figure 186.

- **Depth** – sets the extrusion depth and direction from the pop-up options.
- **Direction** – sets a view direction and a perspective or parallel projection from the pop-up options.
- **Lighting** – sets the lighting direction and lighting intensity from the pop-up options.
- **Surface** – sets the surface material or use a wireframe display from the pop-up options.
- **3D Color** – sets the extrusion color from the pop-up options.

![3D-Settings toolbar - editing](image)

The result of any changes made using these editing tools is applied to the selected 3D shape immediately and the effect is displayed.

| Note | The 3D Effects dialog described in “3D effects” on page 138 cannot be used on 3D shapes created using the Extrusion On/Off tool because the correct formatting results will not be achieved. If you have used the 3D Effects dialog in error, you can remove any incorrect formatting by going to Format > Default Formatting on the main menu bar. |

Combining 3D objects
Multiple 3D objects can be grouped or combined together in the same way as 2D objects. See Chapter 5 Combining Multiple Objects for more information.

| Note | When copying and pasting a 3D scene into another 3D scene, it is not pasted in as a scene, but the objects within the copied scene are pasted in. |
Chapter 8
Connections, Flowcharts, and Organization Charts
Connectors and glue points

Connectors and glue points were briefly introduced in Chapter 2 Drawing Basic Shapes. This section describes them in more detail and how to use them.

Connectors are lines or arrows whose ends automatically dock to a connection or glue point on an object. Connectors are useful when drawing, for example, flowcharts and organization charts. The connecting lines between objects remain intact even when objects are moved or rearranged. Also, if you copy an object with a connector, the connector is also copied.

Connectors

Draw has a comprehensive selection of connectors on a Connectors toolbar (Figure 187) to help you connect objects in, for example, a flowchart or organization chart. To open this toolbar, click the small triangle to the right of the Connector icon on the Drawing toolbar. Note that this icon changes shape depending on the last connector tool used. This toolbar can become a floating toolbar by clicking on the bottom of the pop-up toolbar and dragging it into your workspace.

Types of connectors

Connectors fall into four type groups:

- **Standard connectors** (Figure 188) – the line segments run vertically and horizontally. Draws a connector with one or more 90-degree angle bends. Click on an object glue point on an object, drag to a glue point on another object, then release.

- **Line connectors** (Figure 189) – consist of a line segment with two smaller segments at the ends. Draws a connector that bends near a glue point. Click on an object glue point, drag to a glue point on another object, then release. To adjust the length of the line segment between a bend point and a glue point, click the connector and drag the bend point.
Figure 189: Line connectors

- **Straight connectors** (Figure 190) – consist of a single line. Draws a straight line connector. Click on an object glue point, drag to a glue point on another object, then release.

Figure 190: Straight connectors

- **Curved connectors** (Figure 191) – are based on Bézier curves and curve around objects. Draws a curved line connector. Click on an object glue point, drag to a glue point on another object, then release.

Figure 191: Curved connectors

**Adding connectors**

When you select a connector and move the mouse pointer over a filled object or the edge of an unfilled object, glue points appear. A glue point is a fixed point where you can attach a connector line. You can also add custom glue points to an object, see “Glue points” on page 153 for more information.

Figure 192: Connector between two objects
To draw a connector, select the connector type and click on a glue point on an object. Drag the cursor to a glue point on another object and then release. Figure 192 shows a line connector drawn between two objects. Remember not to drag the connector so that it overlaps or touches any objects and creates a confusing drawing. If this does happen, see “Modifying connectors” below on how to change the connector route to avoid any objects the connector crosses over.

You can also drag a connector to an empty part of your document. When you release the mouse button, the unattached end of the connector is locked into place until you drag the end to a different location.

**Modifying connectors**

To detach or reposition a connector, click and drag either end of the connector line to a different location.

To change the connector route between objects avoiding any objects on the route, click on a control point on the connector line and drag it to a new position. In Figure 192, the control points are shown as small red squares at the point where the connector changes direction.

To modify a connector, right-click on the connector and select **Connector** from the context menu to open the Connector dialog (Figure 193). Use this dialog to change connector type and its properties.

- **Line skew** – defines the skew of the line and the dialog preview displays the result.
- **Line spacing** – sets the spacing for the connectors.
  - *Begin horizontal* – enter the amount of horizontal space you want at the beginning of the connector.
  - *Begin vertical* – enter the amount of vertical space you want at the beginning of the connector.
  - *End horizontal* – enter the amount of horizontal space you want at the end of the connector.
  - *End vertical* – enter the amount of vertical space you want at the end of the connector.

![Connector dialog](Figure_193:Connector_dialog)
Glue points

Glue points are not the same as the selection handles of an object. The selection handles are for moving or changing the shape of an object; see Chapter 3 Working with Objects and Object Points for more information. Glue points are used to fix or glue a connector to an object so that when the object moves, the connector stays fixed to the object.

All Draw objects have glue points, which normally are not displayed and only become visible when the Connectors icon on the Drawing toolbar is selected. Note that the Connectors icon changes shape depending on the last connector tool used.

To add, customize or delete glue points to an object, go to View > Toolbars > Gluepoints on the main menu bar to open the Gluepoints toolbar (Figure 194). This toolbar only becomes active after you click on the Glue Points icon or select Edit > Glue Points on the main menu bar. Figure 192 on page 151 shows an example of active glue points.

![Gluepoints toolbar](image)

**Types of glue points**

When the Gluepoints toolbar opens, only the six tools on the left of the toolbar are active. The remaining six tools on the right of the toolbar only become active when the Glue Point Relative icon is deselected.

With reference to Figure 194, the following briefly describes the function of each tool on the Gluepoint toolbar.

- **Insert Glue Point** – inserts a glue point where you click in an object.
- **Exit Direction Left** – connector attaches to the left edge of the selected glue point.
- **Exit Direction Top** – connector attaches to the top edge of the selected glue point.
• **Exit Direction Right** – connector attaches to the right edge of the selected glue point.
• **Exit Direction Bottom** – connector attaches to the bottom edge of the selected glue point.
• **Glue Point Relative** – maintains the relative position of a selected glue point when you resize an object. This tool is selected by default when the Gluepoint toolbar opens. The following six tools only become active when this tool is deselected.

• **Glue Point Horizontal Left** – when the object is resized, the current glue point remains fixed to the left edge of the object.
• **Glue Point Horizontal Center** – when the object is resized, the current glue point remains fixed to the center of the object.
• **Glue Point Horizontal Right** – when the object is resized, the current glue point remains fixed to the right edge of the object.
• **Glue Point Vertical Top** – when the object is resized, the current glue point remains fixed to the top edge of the object.
• **Glue Point Vertical Center** – when the object is resized, the current glue point remains fixed to the vertical center of the object.
• **Glue Point Vertical Bottom** – when the object is resized, the current glue point remains fixed to the bottom edge of the object.

---

**Note**
Each glue point you have added can have only one horizontal position and one vertical position. Only one of the horizontal position tools and one of the vertical position tools can be selected and used at any one time.

---

**Adding glue points**
By default, most objects normally have four glue points. To add extra glue points to an object or to an object that does not have glue points, proceed as follows:

1) Make sure no objects are selected and click on the **Glue Points** icon or select **Edit > Glue Points** on the main menu bar. Glue points will appear as small crosses on objects (Figure 192 on page 151).

2) If the **Gluepoints** toolbar (Figure 194 on page 153) does not open, go to **View > Toolbars > Gluepoints** on the main menu bar.

3) Select the object and then the **Insert Glue Point** icon.

4) Move your cursor to a position where you want the glue point on an object and click to insert the glue point.

5) To move a glue point to another position, click on the glue point and drag it to its new position. Guide lines automatically appear when moving glue points.

---

**Tip**
When adding, moving or customizing glue points, it is recommended to use the zoom function to make it easier to work with glue points. See Chapter 3 Working with Objects and Object Points for more information.

---

**Customizing glue points**
Only glue points that have added to an object can be customized. The default glue points included with an object cannot be customized.
1) Make sure no objects are selected and click on the Glue Points icon or select Edit > Glue Points on the main menu bar. Glue points will appear as small crosses on objects (Figure 192 on page 151).

2) If the Gluepoints toolbar (Figure 194 on page 153) does not open, go to View > Toolbars > Gluepoints on the main menu bar.

3) Make sure the object is not selected and double-click on a glue point that you have added to select the glue point.

4) Select the exit directions you want to use for connectors and double-click again on the glue point to customize the glue point.

5) To use horizontal and vertical positioning, click on the Glue Point Relative icon or right-click on the glue point and select Adapt Position to Object from the context menu to deselect this tool.

6) Select the horizontal and vertical positioning tools you want to use and double-click on the glue point to customize the glue point. Only one horizontal positioning tool and one vertical positioning tool can be used at any one time.

Deleting glue points

Only glue points that have added to an object can be deleted. The default glue points included with an object cannot be deleted.

1) Make sure no objects are selected and click on the Glue Points icon or select Edit > Glue Points on the main menu bar. Glue points will appear as small crosses on objects (Figure 192 on page 151).

2) Make sure the object is not selected and double-click on a glue point that you have added to select the glue point.

3) Right-click on the glue point and select Cut from the context menu, or press the Delete key on the keyboard, or go to Edit > Cut on the main menu bar.

Connector text

Text can be easily added to connectors, then formatted or edited to make, for example, your flowchart or organization chart easier to follow. See Chapter 2 Drawing Basic Shapes and Chapter 9 Advanced Draw Techniques for more information on working with text.

Adding text

1) Select the connector and the control points become active.

2) Click on the Text icon or Text Vertical icon on the Drawing toolbar and the familiar flashing text cursor appears close to the connector. The Text Formatting toolbar replaces the Line and Filling toolbar.

3) Use the Text Formatting toolbar or Format and Tools on the main menu bar to change the default format of the text.

4) Type the text and, when you have finished typing the text and using the text tools, move the cursor away from the objects and connector and click to end the text mode. The Line and Filling toolbar then replaces the Text Formatting toolbar.

Formatting and editing text

1) Click on the connector text to enter text editing mode. The Text Formatting toolbar replaces the Line and Filling toolbar under the menu bar.
2) Perform any changes to the text using the text tools provided on the Text Formatting toolbar or Format and Tools on the main menu bar. You can also right-click on the text and select text tools from the context menu.

3) Right-click on the connector text and select Text from the context menu or go to Format > Text to open the Text dialog (Figure 195) where you can change the Text anchor and Spacing to borders.

![Figure 195: Text dialog](image)

**Note**

A connector has an invisible rectangle around it. Text anchor will position the text within this invisible rectangle and Spacing to borders will create margins between the text and the borders. These options are in addition to the standard text tools.

4) Click on the Text Animation tab where you can animate the text. However, this is not recommended unless you are going to display the drawing as part of a presentation. See the Impress Guide for more information on text animation.

5) When you have finished formatting and editing your text, move the cursor away from the objects and connector and click to end the text mode. The Line and Filling toolbar then replaces the Text Formatting toolbar.

### Flowcharts

For drawing flowcharts (also known as flow diagrams), Draw has a Flowchart toolbar that includes a large selection of flowchart tools to help you to easily draw a flowchart. Click on the small triangle to the right of the Flowchart icon on the Drawing toolbar to open the Flowchart toolbar. Note that this icon changes shape depending on the last flowchart tool used. This toolbar can become a floating toolbar by clicking on the bottom of the pop-up toolbar and dragging it into your workspace.

1) When adding objects to your flowchart, see Chapter 2 Drawing Basic Shapes for information on how to draw and resize object shapes.
2) Add text to each flowchart shape to make it easily identified in the flowchart. See Chapter 2 Drawing Basic Shapes and Chapter 9 Advanced Draw Techniques for more information.

3) Use connections lines in your flowchart. This allows repositioning of an object in your chart while maintaining connections with the other objects in the chart. See “Connectors” on page 150 for more information.

4) Use the zoom, grid and snap functions to help in positioning objects in your flowchart. See Chapter 3 Working with Objects and Object Points for more information.

5) Use the alignment and distribution functions to give your flowchart a more professional look. See Chapter 5 Combining Multiple Objects for more information.

6) Duplicate objects when you require more than one of the same shape and size. See Chapter 5 Combining Multiple Objects for more information.
**Organization charts**

Draw does not have a toolbar for organization charts, but these charts are easily created using basic shapes, flowchart shapes, connection points and connector lines. Hierarchy in an organization is easily indicated using shading and/or color. When using shading and color in an organization chart, make sure that your choices provide a good contrast between the text and the shading or color to make the chart easy to read on a computer display or in a printed document.

An example of an organization chart is shown in Figure 197. This was drawn using the process shape from the **Flowchart** toolbar and connection lines.

1) When adding objects to your chart, see *Chapter 2 Drawing Basic Shapes* for information on how to draw and resize object shapes.

2) Add text to each object in the organization chart to make it easily identified in the chart. See *Chapter 2 Drawing Basic Shapes* and *Chapter 9 Advanced Draw Techniques* for more information.

3) Use connections lines in your organization chart. This allows repositioning of an object in your chart while maintaining connections with the other objects in the chart. See "Connectors" on page 150 for more information.

4) Use the zoom, grid and snap functions to help in positioning objects in your chart. See *Chapter 3 Working with Objects and Object Points* for more information.

5) Use the alignment and distribution functions to give your organization chart a more professional look. See *Chapter 5 Combining Multiple Objects* for more information.

6) Duplicate objects when you require more than one of the same shape and size. See *Chapter 5 Combining Multiple Objects* for more information.

![Figure 197: Example organization chart](image)

LibreOffice 4.1 Draw Guide
Chapter 9
Adding and Formatting Text
Introduction

When text is used in drawings, it is contained in text boxes. This chapter describes how to create, format, use, and delete text. It also discusses the various types of text that can be inserted into a drawing. Finally, it provides information on how to insert special forms of text such as numbered or bulleted lists, tables, fields, and hyperlinks.

Using the text tool

To activate the text tool, click the Text icon for horizontal text or the Vertical Text icon for vertical text on the Drawing toolbar.

If the Vertical Text icon is not visible, select the option Show UI elements for East Asian writings in Tools > Options > Language Settings > Languages. Right-click on the Drawing toolbar and go to Visible Buttons > Vertical Text and the icon will be placed on the toolbar.

After activating the text tool, the Text Formatting toolbar (Figure 198) replaces the Line and Filling toolbar at the top of the drawing workspace. Click at the location where you want to position the text and a small text frame appears containing only the cursor.

When the Text icon is selected, you can select font type, font size, and other text properties before you start typing text. As you type the text, the left corner of the status bar indicates that you are in text edit mode and the position of your cursor (Figure 199).

Once you have finished typing your text and clicked outside the text frame or selected another tool from the Drawing toolbar, the Text Formatting toolbar is replaced by the default Line and Filling toolbar.

Using text boxes

Using text boxes, you can place text anywhere on your drawing; for example, a caption for a shape; an explanatory note; a title block for the drawing similar to those used in engineering drawings.
Creating a text box

1) Click the Text icon or the Vertical Text icon on the Drawing toolbar.
2) Click and drag to draw a text box on the drawing. This sets the width. The height of the text box automatically increases as you type or add text.
3) Release the mouse button when you have reached the desired width for your text box. The cursor appears in the text box and the text box has a hashed border indicating edit mode (Figure 200).

![Figure 200: Text box in edit mode](image)

4) Type or paste your text in the text box. The status bar at the bottom of your drawing workspace will indicate that you are in text edit mode and the cursor position within the text box.
5) Click outside the text box to deselect it.
6) To reposition the text box to a different location in your drawing, see “Moving a text box” below and to change the width, see “Resizing a text box” below.

Moving a text box

1) Click on the text to switch the text box into edit mode. The text box has a hashed border visible around the edges (Figure 200).
2) Move the cursor over the hashed border. The cursor changes shape to the move symbol for your computer setup (for example, a clenched hand).
3) When the move symbol appears, click once again on the hashed border and selection handles appear.
4) With the cursor on the hashed border (but not on a selection handle), click and drag to move the text box to a new position. A semi-transparent copy of the text box shows where your text box will be placed (Figure 201). Also, depending on computer setup, guide lines may appear while you move the text box.
5) Release the mouse button when the text box is in the desired position.

![Figure 201: Moving a text box](image)

Resizing a text box

1) Click on the text to switch the text box into edit mode. The text box has a hashed border visible around the edges (Figure 200).
2) Move the cursor over the hashed border. The cursor changes shape to the move symbol for your computer setup (for example, a clenched hand).

3) When the move symbol appears, click once again on the hashed border and selection handles appear.

4) Move the cursor over one of the selection handles and the cursor changes shape to the resizing symbol for your computer setup (for example, a double headed arrow).

5) Click and drag the border to a new position to resize the text box (Figure 202). Depending on computer setup, guide lines may appear while you move the text box.

6) Release the mouse button when the text box reaches the desired size.

![Figure 202: Resizing a text box](image)

**Note**

Use the selection handles at the top and bottom of the text box to resize the text box height.

Use the selection handles at the left and right side of the text box to resize the text box width.

Use the corner selection handles to resize the height and width of the text box while maintaining the aspect ratio of the text box.

**Tip**

To maintain the aspect ratio of a text box while resizing, press and hold the *Shift* key, then click and drag. Make sure to release the mouse button *before* releasing the *Shift* key.

**Using the Position and Size dialog**

For more accurate control over the size and position of a text box you can use the **Position and Size** dialog.

1) Click on the text to switch the text box into edit mode.

2) Press the *F4* key or select **Format > Position and Size** from the menu bar to open the Position and Size dialog (Figure 203).

The options available on the **Position and Size** dialog are as follows:

- **Position** – specifies the location of the selected object on the page.
  - *Position X* – enter the horizontal distance that you want to move the object relative to the base point selected in the grid.
  - *Position Y* – enter the vertical distance that you want to move the object relative to the base point selected in the grid.

- **Base point** – click a base point in the grid and then enter the amount that you want to shift the object relative to the base point that you selected in the Position Y and Position X boxes. The base points correspond to the selection handles on an object.
Figure 203: Position and Size dialog

- **Size** – specifies the amount by which you want to resize the selected object with respect to the selected base point.
  - *Width* – enter a width for the selected object.
  - *Height* – enter a height for the selected object.
  - *Keep ratio* – maintains proportions when you resize the selected object.
- **Base point** – click a base point in the grid and then enter the new size dimensions for the selected object in the Width and Height boxes.
- **Protect** – prevents any editing of an object.
  - *Position* – prevents changes to the position or the size of the selected object.
  - *Size* – prevents you from resizing the object.
- **Adapt** – resizes text in a drawing object with respect to the borders of the selected object.
  - *Fit width to text* – resizes the text to fit the width of the selected object.
  - *Fit height to text* – resizes the text to fit the height of the selected object.

### Deleting a text box

1. Click on the text to switch the text box into edit mode.
2. Move the cursor over the hashed border. The cursor changes shape to the move symbol for your computer setup (for example, a clenched hand).
3. When the move symbol appears, click once again on the hashed border and selection handles appear.
4. Press the **Delete** key.

**Tip**

Sometimes it is quicker to to delete a text box by dragging a selection rectangle around the text box and then hitting the **Delete** key. Take care to avoid selecting and accidentally deleting other text boxes or shapes.
Using text with Draw objects

Text can be added to most Draw objects. The exceptions are control elements like buttons, list boxes, or 3D objects. An object is not dynamic and does not behave like a text frame. To keep text within the borders of the object, you have to use paragraphs, line breaks, smaller text size, increasing the object size, or a combination of all four methods.

To add text to an object:

1) Select the object.
2) Select the Text icon on the Drawing toolbar and a text cursor starts flashing in the center of the selected object.
3) Start typing your text (Figure 204). The status bar will indicate that you are editing text, as shown in Figure 199.
4) Alternatively, double-click on an object to enter text editing mode. If double-clicking does not work, then open the Options toolbar and select the Double-click to edit Text icon.

![Figure 204: Adding text to an object](image)

Inserting text

Pasting text

Text may be inserted into a text box or object by copying it from another document and pasting it into a text box or object on your drawing. However, pasted text may not match the formatting of the text that has already been included on your drawing. This may be what you want on some occasions, but in most cases it is better to make sure that text format is consistent throughout your drawing.

**Pasting unformatted text**

It is good practice to paste text without formatting and apply the formatting later so it matches the text already in your drawing or make the text fit within the borders of an object.

1) Copy the text you want to use, then move your cursor into position on your drawing.
2) Go to Edit > Paste Special on the main menu bar or use the keyboard shortcut Control+Shift+V or click on the small triangle next on the right of the Paste icon on the Standard toolbar.
3) Select Unformatted text from the dialog or context menu that appears. The text will be pasted at the cursor position and formatted to the default paragraph style of the text box or object.
**Formatting pasted text**

1) Select the text you have just pasted (see “Selecting text” on page 167 for more information).

2) Use the formatting tools that are available on the Text Formatting toolbar, or go to Format on the main menu bar and select a formatting tool from the drop down menu, or right-click on the text and select a formatting tool from the context menu.

3) Alternatively, go to Format > Styles and Formatting or press the F11 key to open the Styles and Formatting dialog. See “Using styles” on page 167 for more information.

**Inserting special characters**

To insert special characters, such as copyright, math, geometric, monetary symbols, or characters from another language:

1) Click on the Text icon and then click in the text where you want to insert the character.

2) Go to Insert > Special Character on the main menu bar or right-click and select Special Characters from the context menu to open the Special Characters dialog (Figure 205).

3) Alternatively, click on the Special Character icon on the Text Formatting toolbar to open the Special Characters dialog. If this icon is not visible, right-click in an empty on the toolbar and select Visible Buttons > Special Character from the context menu and the icon will be placed on the toolbar.

4) Select the font and character subset from the Font and Subset options in the Special Characters dialog.

5) Select the character you want to insert. You may have to scroll to find the character you want.

6) Click OK.

![Figure 205: Special Characters dialog](image)

**Note**

Characters you select will be inserted in the order they were selected, even if you accidentally click on the wrong character. Clicking on another character will only add it to the ones being inserted. Click Delete to delete all the characters selected, then click on the correct characters.
Inserting non-breaking spaces and hyphens

Where it is not desirable for words that are separated by a space or a hyphen to span over two lines, or where an optional hyphen is desired, you can insert a special formatting mark. Draw supports the following formatting marks:

- **Non-breaking space** – inserts a space that will keep bordering characters together on line breaks.
- **Non-breaking hyphen** – inserts a hyphen that will keep bordering characters together on line breaks.
- **Optional hyphen** – inserts an invisible hyphen within a word that will appear and create a line break once it becomes the last character in a line.
- **No-width optional break** – inserts an invisible space within a word that will insert a line break once it becomes the last character in a line. Only available when complex text layout (CTL) is enabled.
- **No-width no break** – inserts an invisible space within a word that will keep the word together at the end of a line. Only available when complex text layout (CTL) is enabled.
- **Left-to-right mark** – inserts a text direction mark that affects the text direction of any text following the mark. Only available when complex text layout (CTL) is enabled.
- **Right-to-left mark** – inserts a text direction mark that affects the text direction of any text following the mark. Only available when complex text layout (CTL) is enabled.

To insert a non-breaking space, or hyphens, or access the formatting marks:

1) Click on the **Text** icon and place the cursor in the text where you want to use formatting marks.
2) Go to **Insert > Formatting Mark** on the main menu bar.
3) Select the formatting mark you want to use from the context menu that opens. A non-breaking space can be inserted using the keyboard shortcut is **Ctrl+Shift+Space**. A no-width-optional break can be inserted using the keyboard shortcut is **Ctrl+Slash**.

### Formatting text

The appropriate use of text formatting can give text in a drawing a consistent look, making your drawing look more professional without any distracting elements.

**Tip**

Sometimes it is very useful to re-apply the default style to a selection of text removing any manual formatting applied to it, especially if a mistake has been made and you are not sure how to undo it. To revert back to the default style, select the manually formatted text and then select **Format > Default formatting** from the main menu bar.

Formatting text may require some intervention in three areas:

- Character attributes (for example, font color or emphasis)
- Paragraph attributes (for example, alignment or spacing)
- List attributes (for example, type of bullet or indent spacing)

In some cases it is quicker and more efficient to apply manual formatting; but in situations where you need to perform the same modifications to many different parts of the drawing, the use of styles is recommended.
Selecting text

Text must be selected before it can be formatted.

To format all the text in a text box:
1) Click on the Text icon and then click once on the text.
2) Click once on the border of the text box. The selection handles are displayed.
3) Go to Format on the main menu bar or right-click in the text box and select the type of formatting required, for example Character or Paragraph.
4) Any formatting changes will apply to all the text in the text box.

To format only part of the text in a text box or object:
1) Click on the Text icon and then click once on the text.
2) Select the text to be formatted by clicking and dragging over it (highlighting). You can also use the following keyboard shortcut combinations to select text after positioning the cursor where you want to begin your selection:
   a) Press Shift then use the arrow keys to extend your selection.
   b) Press Shift+Ctrl then use the arrow keys to select whole words.
   c) Press Shift+Home to select to the beginning of the line.
   d) Press Shift+End to select to the end of the line.
3) Go to Format on the main menu bar or right-click in the text box and select the type of formatting required, for example Character or Text.
4) Alternatively, use the tools on the Text Formatting toolbar to format the text.
5) Any formatting changes will apply only to the selected text.

Using styles

Only graphic styles are available in Draw to format text. Each graphic style listed in the Styles and Formatting dialog (Figure 206) has default settings for formatting and layout. You can create new styles and modify the styles supplied with Draw.

Figure 206: Styles and Formatting dialog
Creating styles

1) Go to Format > Styles and Formatting on the main menu bar or press the F11 key to open the Styles and Formatting dialog (Figure 206).
2) Right-click on a style name and select New from the context menu to open the Graphic Styles dialog (Figure 207).
3) Using the Graphic Styles dialog, set all the attributes for your text and paragraph by clicking on the various tabbed pages that are available.
4) Click OK when finished and your new style is added to the list in the Styles and Formatting dialog.
5) Alternatively, select your text and perform all the changes to format, then click on the New Style from Selection icon to open the Create Style dialog.
6) Type a unique style name and click OK. This closes the Create Style dialog and your new style is added to the list in the Styles and Formatting dialog.

Modifying styles

1) Go to Format > Styles and Formatting on the main menu bar or press the F11 key to open the Styles and Formatting dialog (Figure 206).
2) Right-click on the style to be modified and select Modify from the context menu to open the Graphic Styles dialog (Figure 207).
3) Using the Graphic Styles dialog, modify all the attributes for your text and paragraph by clicking on the various tabbed pages that are available.
4) Click OK when finished making changes and the style is saved with the new format attributes.
5) Alternatively, select your text and perform all the changes to format, then select a style in the Styles and Formatting dialog.
6) Click on the Update Style icon and the style is saved with the new format attributes.

Formatting characters

Text characters can be independently formatted from the format used for a paragraph of text. This character formatting will also override any formatting that has been applied using a graphic style. Note that character styles are not available in Draw.
1) Click on the **Text** icon, then select the characters you want to format.

2) Go to **Format > Character** on the main menu bar, or click the **Character** icon on the **Text Formatting** toolbar, or right-click on the selected character and select **Character** to open the **Character** dialog (Figure 208).

3) Make your changes to the character formatting using the tabbed pages, then click **OK** to save your changes.

4) Click **Reset** to cancel any changes you have made to the character format and the characters revert back to the original paragraph formatting.

![Figure 208: Character dialog](image)

The tabbed pages in the **Character** dialog are used as follows:

- **Font** – select the desired font type, its base attributes (*Italic*, *Bold*, Language and so on) as well as the size. A sample of the font is displayed in the lower part of the dialog. This font page is also available when creating or modifying a graphics style. If support for Asian language and Complex Text Layout (CTL) font has been enabled (**Tools > Options > Language Settings > Languages**), then the Font page is divided into three parts for Western, Asian and CTL text fonts allowing you to specify text fonts and their attributes for the majority of font families.

- **Font Effects** – apply special effects to the text, such as over lining and underlining, color, shadow and so on. A sample of the text is displayed in the lower part of the dialog as a quick visual check of the effects applied. This page is also available when creating or modifying a graphics style.

- **Position** – sets the text position relative to the baseline when you need to insert subscripts or superscripts. This page is not available when creating or modifying a graphics style.
  - **Scaling** – specifies the percentage of the font width by which to compress or expand the *individual* characters of the selected text.
  - **Spacing** – sets the spacing between the characters of the font, which can be defined in number of points.
- Pair kerning – automatically adjusts the spacing between certain pairs of characters to visually improve the appearance.

**Formatting paragraphs**

Paragraph formatting will override any formatting that has been applied using a graphic style.

1) Click on the **Text** icon then select the paragraph you want to format.

2) Go to **Format > Paragraph** on the main menu bar, or click the **Paragraph** icon on the **Text Formatting** toolbar, or right-click on the selected text and select **Paragraph** to open the **Paragraph** dialog (Figure 209).

3) Make your changes to the paragraph formatting using the tabbed pages then click **OK** to save your changes.

4) Click **Reset** to cancel any changes you have made to the paragraph format and the text reverts back to its original formatting.

![Paragraph dialog](image)

**Figure 209: Paragraph dialog**

The tabbed pages in the **Paragraph** dialog are used as follows:

- **Indents and Spacing** – determines the indents and spacing used in a paragraph.
  - **Indent** – modifies the indentation of the text (before and after) as well as the indentation of the first line.
  - **Spacing** – defines the space before and after each paragraph formatted with the style.
  - **Line spacing** – determines the spacing between two lines formatted with the style. Note that selecting **Proportional** spacing requires specifying the percentage of a line to be used as spacing; 100% single line, 200% double line, 50% half a line. If **Leading** is selected, specify the amount of line spacing in your default unit of measurement.

| Tip | Setting line spacing to less than 100% is a good method to cram a lot of text into a text box, however care must be taken as too small a value will make the text hard to read. |
Tip

You can change the default unit of measurement by going to Tools > Options > LibreOffice Draw > General.

- **Alignment** – determines the paragraph alignment: Left, Right, Center, or Justified. A preview shows the effects of the changes. This page is also available in the graphics styles dialog. The same alignment options can be accessed using the paragraph alignment icons on the Text Formatting toolbar.

Note

If you have Complex Text Layout enabled in Tools > Options > Language Settings > Languages, an extra selection — Text Direction — appears at the bottom of the dialog; you can choose Left-to-right or Right-to-left.

- **Tabs** – determines the tab stops. This page is also available in the graphics styles dialog.
- **Asian Typography** – sets the following properties relative to line changes and is only available if Enabled for Asian Languages is selected in Tools > Options > Language Settings > Languages. This page is also available in the graphics styles dialog.
  - Apply list of forbidden characters to the beginning and end of lines.
  - Allow hanging punctuation.
  - Apply spacing between Asian, Latin and Complex text.

Creating bulleted and numbered lists

Bulleted and numbered lists can be created in text boxes, shapes and objects. When creating lists in shapes and objects, remember that shapes and objects are not dynamic and do not expand as you create a list.

![Bullets and Numbering dialog](image)

Figure 210: Bullets and Numbering dialog
Creating lists

1) Click on the Text icon then select the text you want to use for a bulleted list.
2) Go to Format > Bullets and Numbering on the main menu bar, or right-click on the selected text and select Bullets and Numbering to open the Bullets and Numbering dialog (Figure 210).
3) Select the list style from the Bullets, Numbering or Graphics pages then click OK to save your changes.
4) Alternatively, click the Bullets On/Off icon on the Text Formatting toolbar. This quickly creates a list using the previously selected settings in the Bullets and Numbering dialog.
5) Click Reset to cancel any changes you have made and the text reverts back to its original formatting.

Editing and customizing a list

You can edit and customize the appearance of a list by changing the bullet type or numbering for the entire list or single entry or the outline level of a list item. All changes are made using the Bullets and Numbering dialog.

Editing a list

1) Click on the Text icon, then select the list or the items in the list that you want to edit and customize.
2) Go to Format > Bullets and Numbering, or right-click on the selected text and select Bullets and Numbering to open the Bullets and Numbering dialog (Figure 210).
3) Select a new list style from the Bullets, Numbering or Graphics pages.
4) Click OK to save your changes.

Changing position

Use the Position page (Figure 211) to adjust the outline level, indentation and spacing of bullet points and the associated text. This page is particularly effective when used in combination with the Customize page.

To set up an outline level:

1) Select an outline level from the list on the left hand side of the page or select levels 1 – 10 to modify all levels simultaneously.
2) Set the Indent, which is the spacing between the bullet or number and the text. If you select the Relative option, the indent value will be measured relative to the previous level and not from the margin.
3) Set the measurement for Width of numbering. This is the space to leave between the numbering or bullet point and the text.
4) Set the Numbering alignment and is normally only used on a numbered list. Setting this option does not set the alignment of the text.
   a) Select Left to align the numbering at the left edge of the alignment space for numbering.
   b) Select Right to align the numbering at the right edge of the alignment space for numbering.
   c) Select Centered to align the numbering in the center of the alignment space for numbering.
5) Click OK to save your changes.
6) To revert back to the default values of the list, click Reset.
Tip

To fully appreciate how Numbering alignment works, create a numbered list with more than ten elements, making sure there is enough room for two (or more) numerical characters using the Width of numbering field. Select Right alignment and the right edge of the numbers will form a neat, straight line before the text.

Customizing

Use the Customize page (Figure 212) to customize the style of all the outline levels. The options available on this page depend on the type of marker selected for the list.

To customize a bullet or numbered list:

1) Select first the level you want to modify on the left hand side of the box. To modify all levels at once, select 1 – 10 as the level. With levels being arranged in a hierarchical structure, changing, for example, the font attribute of one of the levels ripples through all the lower levels.

2) Make your changes to your list using the options on this page. The preview on the right hand side of the dialog shows the effect of the changes.

3) Click OK to save your changes.

4) To revert back to the default values of the list, click Reset.

Depending on the bullet style selected (bullet, numbering; graphic), some of the following options may not be available on the Customize page:

- **Before** – enter any text to appear before the number (for example, Step).
- **After** – enter any text to appear after the number (for example, a punctuation mark).
- **Color** – pick the color for the list marker (number or bullet character).
- **Relative size** – specify the size of the number relative to the size of the characters in the paragraph of the list.
- **Start at** – enter the first value of the list (for example, you might want the list to start at 4 instead of 1).
Using tables

Tables are useful when you want to show structured information in your drawing, for example a specification list or drawing title block. You can create tables directly in Draw, eliminating any need to embed a Calc spreadsheet or a Writer text table in your drawing. The tables provided by Draw do have a limited functionality.

Creating a table

When working with tables, it is useful to know the number of rows and columns needed as well as the appearance. Tables are placed on a drawing in a text box and cannot be placed into objects or shapes. Also, unlike text boxes and other graphic objects, tables cannot be rotated.
To insert a table, proceed as follows:

1) Go to Insert > Table on the main menu bar to open the Insert Table dialog (Figure 213).
2) Select the number of columns and number of rows for your table.
3) Click OK and a table is placed in the center of your drawing inside its own text box.
4) Move your table into position by dragging it to its new position, or using the method in “Using the Position and Size dialog” on page 162.

Modifying a table

Once the table is added to your drawing, you can control its appearance, size, position and so on using a combination of the tools on the Table toolbar (Figure 214) and the Format Cells dialog (Figure 218). The Table toolbar is only active when a table has been selected. If the Table toolbar does not display when you select a table, go to View > Toolbars > Table. If it is appended to the Drawing toolbar, the Table toolbar can be expanded by detaching and moving it.

Figure 214: Table toolbar and table tools

Figure 215: Table graphic tool

Table toolbar

The Table toolbar contains the majority of the tools you need to manipulate a table. These tools are shown in Figure 214 and described below.
• **Table** – creates a new table in a drawing. Opens the **Insert Table** dialog (Figure 213) where you can select the required number of rows and columns. Alternatively, click on the small triangle next to the **Table** icon to open a graphic representation for creating a table (Figure 215). To use this tool, move the mouse to the right and down in the grid until you have the columns and rows you require and click the left mouse button.

• **Line Style** – changes the line style of the borders of selected cells. Opens a new dialog where you can choose from a range of predefined styles.

• **Line color (of the border)** – opens a color selection dialog where you can choose the color of the borders around selected cells.

• **Borders** – selects predefined border configurations. The borders are applied to the selected cells. If the desired border pattern is not available, you will need to use the **Format Cells** dialog.

• **Area Style/Filling** – select the cells to be filled, then select the type of fill from the drop down list: *Invisible* (no color), *Color*, *Gradient*, *Hatching*, or *Bitmap*. Depending on the fill type selected, the fillings drop-down menu is populated with the available fillings for the fill type selected.

• **Merge Cells** – merges the selected cells into one cell. Note that the contents of the merged cells are also merged. You can also merge cells by right-clicking in the selected cells and using the context menu that opens.

• **Split Cells** – opposite operation of merging cells. Make sure that the cursor is positioned on the cell you want to split, then click to open the Split Cells dialog (Figure 216). Select the number of cells required from the split as well as whether the cell should be split horizontally or vertically. When splitting horizontally, you can select the *Into equal proportions* option to get all cells of equal size. The contents of the split cell remain in the original cell (the one on the left or top). You can also split cells by right-clicking in the cell and using the context menu that opens.

![Split Cells dialog](image)

*Figure 216: Split Cells dialog*

• **Optimize** – evenly distributes the selected cells either horizontally or vertically. If you want to optimize the whole table, you can evenly distribute columns or rows by clicking on the small triangle next to the icon and selecting **Distribute Columns Evenly** or **Distribute Rows Equally**.

• **Top, Center (vertical), Bottom**– you can select the vertical alignment of text in a cell by selecting the required cells and clicking on one of these tools.

• **Insert Row, Insert Column, Delete Row, Delete Column** – select a row or column and use these four tools to insert or delete rows and columns into or from your table. Rows and columns are inserted/deleted below and to the right of the selected cell. You can also select, insert or delete rows and columns by right-clicking a cell and using the context menu that opens.
• **Select Table, Select Column, Select Row** – Use these tools to select a table, column or row if you want to perform the same change to attributes for a table, column or row.

• **Table Design** – opens the Table Design dialog (Figure 217) where you can select a table style and display options.

![Figure 217: Table Design dialog](image)

Figure 217: Table Design dialog

![Figure 218: Format Cells dialog](image)

Figure 218: Format Cells dialog
• **Table Properties** – opens the **Format Cells** dialog (Figure 218), which contains the following tabbed pages. You can also open this dialog by right-clicking on the table and selecting **Table** from the context menu.

  - **Font** – use to select the desired font type and family, style (**Italic**, **Bold**, etc.), size and language. A sample of the font is displayed in the lower part of the dialog.
  
  - **Font Effects** – use to apply effects to the text: font color; relief; overlining; strikethrough; underlining and emphasis mark.
  
  - **Borders** – use to set borders and border properties not available when using the **Borders** tool on the **Table** toolbar; line arrangement (default or user defined), line (style, width, and color) and spacing to contents (cell margins).
  
  - **Background** – changes the background of the selected cells and provides the same functions as the **Area Style/Filling** tool on the **Table** toolbar.
  
  - **Reset** – clicking this button resets the table back to default values.

**Position and size**

You can change table position and size on a drawing by using the mouse or, for more accurate control, with the **Position and Size** dialog (Figure 203 on page 163). When the table is selected, right-click on the table and select **Position and Size** from the context menu or go to **Format > Position and Size** on the main menu bar or press the **F4** key to open the dialog. See “Using the Position and Size dialog” on page 162 for more information.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlike text boxes and other graphic objects, tables cannot be rotated.</td>
</tr>
</tbody>
</table>

**Deleting a table**

To delete a table:

1) Click and drag over the table to select it or select the table then click on the text box border around the table.

2) Press the **Delete** key.

**Using fields**

Fields allow the automatic insertion of text into a drawing. You can think of a field as a kind of formula which is calculated when the drawing is loaded or printed and the result is written in the drawing.

**Inserting a field**

To insert a field into a drawing:

1) Move the cursor where the field will be positioned. The text box created when you insert a field can be repositioned just like a text box.

2) Go to **Insert > Fields** on the main menu bar.

3) Select a field from the options shown in the context menu.

The fields available in Draw are as follows:

- **Date (fixed)** – inserts the date at the date of inserting the field.

- **Date (variable)** – inserts a field that is updated with the date at the time of opening the file.

- **Time (fixed)** – inserts a field displaying the time at the time of insertion.
• **Time (variable)** – inserts a field which is updated with the time at the time of opening the file.

• **Author** – inserts the author of the drawing. This information is derived from the value recorded in the general options. To modify this information go to **Tools > Options > LibreOffice > User Data**.

• **Page Number** – inserts the page number of the slide.

• **Page Count** – inserts the total number of slides.

• **File Name** – inserts a field that contains the name of the file.

### Customizing fields

The appearance of fields can be customized as follows. The **Page Number**, **Page Count**, and **File Name** fields cannot be customized.

1) Place the cursor at the start of the field data and go to **Edit > Fields**
2) Select the desired format from the options available in the **Edit Field** dialog (Figure 219).
3) Click **OK**.

![Figure 219: Edit Field dialog](image)

### Using hyperlinks

When inserting text (for example website address or URL) that can be used as a hyperlink, Draw formats it automatically, creating the hyperlink and applying color and underlining.

To insert a hyperlink, or to customize the appearance of a hyperlink, go to **Insert > Hyperlinks** on the main menu bar or click on the **Hyperlink** icon on the **Standard** toolbar to open **Hyperlink** dialog (Figure 220).

On the left side, select one of the four types of hyperlinks. The dialog changes according to the type of hyperlink selected.

• **Internet** – select whether the link is Web or FTP. Enter the required web address (URL).

• **Mail & News** – select whether the link is an E-mail or news link. Enter the receiver address and for email, also the subject.
• **Document** – creates a hyperlink to another document or to another place in the drawing, commonly referred to as a bookmark. Enter the document path, or click on the *Open File* icon to open a file browser; leave this blank if you want to link to a target in the same drawing. Optionally, you can specify a target (for example, a specific slide). Click on the *Target* icon to open the *Target in Document* dialog, where you can select the target; or, if you know the name of the target, you can type it into the box.

• **New Document** – creates a hyperlink to a new document. Choose whether to edit the newly created document immediately (*Edit now*) or just create it to edit later (*Edit later*). Choose the type of document to create (text, spreadsheet, etc.). The *Select path* button opens a file browser so that you can choose the directory for the new document.

---

**Tips**

To prevent LibreOffice from automatically turning website addresses (URLs) into hyperlinks, go to *Tools > AutoCorrect > Options* and deselect the *URL Recognition* checkbox.

To change the color of hyperlinks, go to *Tools > Options > LibreOffice > Appearance*, scroll to *Unvisited links* and/or *Visited links*, select the checkboxes, pick the new colors and click *OK*. Caution: this will change the color for all hyperlinks in all components of LibreOffice which may not be what you want.

The *Further settings* section on the *Hyperlink* dialog is common to all the hyperlink types, although some choices are more relevant to some types of links.

• **Frame** – determines how the hyperlink will open. This applies to documents that open in a Web browser.

• **Form** – specifies if the link is to be presented as text or as a button. See “Working with hyperlink buttons” on page 181 for more information.

• **Text** – specifies the text that will be visible to the user.

• **Name** – applicable to HTML documents. It specifies text that will be added as a NAME attribute in the HTML code behind the hyperlink.
Editing text hyperlinks

1) Select the hyperlink by dragging across the text, not clicking on it.
2) Go to Edit > Hyperlink from the main menu bar.
3) Make changes as needed and click Apply when done. If you need to edit several hyperlinks, click Apply after each one.
4) When you are finished editing hyperlinks, click Close.

Working with hyperlink buttons

A hyperlink button is inserted in the center of the current drawing. In most cases, that is not where you want it to appear. To edit the text or size of a hyperlink button, or to move it to another place on the drawing:

1) Go to View > Toolbars > Form Controls on the main menu bar to open the toolbar (Figure 221).
2) Select the Design Mode On/Off icon.
3) Now click on the hyperlink button and drag it to another position, or right-click to open a dialog where you can change the text on the button, the size of the button, and other properties.
4) When you have finished editing the button, click the Design Mode On/Off icon again to make the button inactive. For a more detailed description of the properties and how to work with Form Controls, refer to the Writer Guide.

Figure 221: Form Control toolbar and tools
Chapter 10
Printing, Exporting & E-mailing
Printing

Quick printing

To quickly print a document or drawing, click on the Print File Directly icon on the Standard toolbar to send the entire document to the default printer that is defined for your computer.

Note

You can change the action of the Print File Directly icon by sending a document to the printer defined for the document instead of the default printer for the computer. Go to Tools > Options > Load/Save > General and select the Load printer settings with the document option.

Controlling printing

For more control over printing, use the Print dialog by going to File > Print on the main menu bar, or the keyboard shortcut Ctrl+P. The Print dialog (Figure 222) has four tabs where you can choose a range of options and these are described in the following sections.

Note

The options selected on the Print dialog only apply to the printing of the current document that is open in Draw. To specify default print settings for LibreOffice, go to Tools > Options > LibreOffice > Print.

Note

If you have the option Use LibreOffice dialogs selected in Tools > Options > General > Print dialogs then the Print dialogs will be similar to the one shown in Figure 222 thru . If Use LibreOffice dialogs is not selected, the Print dialog displayed will depend on your computer setup.

Figure 222. Print dialog – General page
General page
On the General page of the Print dialog (Figure 222), you can select:

- Which printer to use from the printers available in the Printer section.
- Which pages to print, number of copies to print, whether to collate multiple copies, and page order for printing in the Range and copies section.

LibreOffice Draw page
On the LibreOffice Draw page of the Print dialog (Figure 223), you can define settings that are specific to the current document type:

- In the Contents section, print the page name and/or the date and time on the drawing.
- In the Colors section, print the drawing in original colors, as a grayscale, or in black and white.
- In the Size section, print the drawing in its original size, fit the drawing to the printable area of the page, print the drawing on multiple sheets of paper if the drawing is too large for the paper size being used, or print the drawing as multiple tiles on a sheet of paper.

Page Layout page
On the Page Layout page of the Print dialog (Figure 224), you can define the page layout when your drawing is printed.

- In the Layout section, select how many pages per sheet of paper are printed, the order in which the pages are printed on a sheet, whether a border is drawn around each page, or the drawing is printed as a brochure.
- In the Page sides section, select whether to print all the pages, the back sides/left pages only, or the front sides/right pages only. This option is useful when you want to print double-sided when your printer does not support duplex printing.
On the **Options** page (Figure 225) you can select whether to print to file, create single print jobs when you want to use collated output, use only the printer tray specified in the printer preferences, or use the paper size specified in the printer preferences.

![Figure 225. Print dialog – Options page](image)
Printing multiple pages on a single sheet

To print multiple pages of a document on one sheet of paper:

1) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the Page Layout page (Figure 224).

2) In the Layout section, select from the Pages per sheet drop-down list the number of pages to print per sheet. The preview panel on the right shows how the pages will look in the printed document.

3) When printing more than two pages per sheet, select the order in which the pages are printed on a sheet from the Order drop-down list.

4) To distinguish each page on a sheet, select the Draw a border around each page option.

5) Click Print.

Selecting pages to print

In addition to printing a full document, you can choose whether to print individual pages, a range of pages, or a highlighted selection within a document.

Individual page

1) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the General page (Figure 222).

2) In the Ranges and copies section, select the Pages option.

3) Enter the number of the page to print.

4) Click the Print button.

Range of pages

1) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the General page (Figure 222).

2) In the Ranges and copies section, select the Pages option.

3) Enter the number of the pages to print (for example 1-4 or 1,3,7,11), or any combination of the two (for example: 1-4,5-9,10).

4) Click Print.

Selection printing

To print a selection from a page or multiple pages:

1) In the document, highlight the section of the page or pages to print.

2) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the General page (Figure 222).

3) In the Ranges and copies section, select the Selection option.

4) Click Print.

Brochure or booklet printing

In Writer, Impress, and Draw, you can print a document with two pages on each side of a sheet of paper, arranged so that when the printed pages are folded in half, the pages are in the correct order to form a booklet or brochure.
Tip
Plan your document so it will look good when printed half size; choose appropriate margins, font sizes, and so on. You may need to experiment.

**Single sided printer**

To print a brochure or booklet on a printer only capable of single sided printing:

1) Go to **File > Print** on the menu bar or use the keyboard shortcut `Ctrl+P` to open the Print dialog and then select the **General** page (Figure 222).
2) Select the printer you want to use if more than one printer is connected to your computer.
3) Click **Properties** to open the properties dialog for the selected printer (Figure 226).
4) Check the printer is set to the same orientation (portrait or landscape) as specified in the page setup for your document. Usually the orientation does not matter, but it does for brochures and booklets.
5) Click **OK** to return to the Print dialog.
6) Select the **Page layout** tab in the Print dialog (Figure 224).
7) Select the **Brochure** option (Figure 227).

8) In the **Page sides** section, select **Back sides/left pages** option from the drop-down list.
9) Click **Print**.
10) Take the printed pages out of the printer, turn the pages over, and put them back into the printer in the correct orientation to print on the blank side. You may need to experiment a bit to find out what the correct arrangement is for your printer.
11) In the **Page sides** section, select **Front sides/right pages** option from the drop down list.
12) Click **Print**.

**Double sided or duplex printer**

To print a brochure or booklet on a printer that is capable of double-sided or duplex printing:

1) Go to **File > Print** on the menu bar or use the keyboard shortcut `Ctrl+P` to open the Print dialog and then select the **General** page (Figure 222).
2) Select the printer you want to use if more than one printer is connected to your computer.
3) Click **Properties** to open the properties dialog for the selected printer (Figure 226).
4) Check the printer is set to the same orientation (portrait or landscape) as specified in the page setup for your document. Usually the orientation does not matter, but it does for brochures and booklets.
5) From the **Duplex** drop down list, select **Long Edge** or **Long Side** printing. Actual options available for duplex printing do depend on printer model and the computer system being used.
6) Click **OK** to return to the Print dialog.
7) Select the **Page layout** tab in the Print dialog (Figure 224).
8) Select the **Brochure** option (Figure 227).
9) In the **Page sides** section, select **All pages** option from the drop-down list.
10) Click **Print**.

**Printing in black and white or grayscale**

You may wish to print documents in black and white or grayscale on a color printer. However, some color printers may only allow you to print in color regardless of the settings you choose. More details can be found in the information that came with your printer.

**Printer settings**

To change the printer settings to print in black and white or grayscale:

1) Go to **File > Print** on the menu bar or use the keyboard shortcut **Ctrl+P** to open the Print dialog and then select the **General** page (Figure 222).
2) Click **Properties** to open the properties dialog for the printer, then click the **Device** tab. The available choices available depend on printer model and computer operating system, but you should easily find options for the **Color** settings. An example of what you may see is shown in Figure 228.

![Figure 228: Printer Properties dialog – Device page](image-url)
3) In Color and select either black and white or grayscale from the drop-down list.
4) Click OK and return to the Print dialog, then click Print to print the document.

**Tip**
Grayscale is the best option if you have any colored text or graphics in the document. Colors will print in shades of gray giving more detail. When printing color in black and white some of this detail may be lost.

**LibreOffice settings**
To change the LibreOffice settings to print all color text and graphics as grayscale:
1) Go to Tools > Options > LibreOffice > Print on the main menu bar.
2) Select Convert colors to grayscale option then click OK to save the change.
3) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the General page (Figure 222).
4) Click Print to print the document.

**Draw settings**
To change the Draw settings to print all color text and graphics as either black and white or grayscale:
1) Go to Tools > Options > LibreOffice Draw > Print on the main menu bar.
2) In the Quality section, select either Grayscale or Black & white option, then click OK to save the change.
3) Go to File > Print on the menu bar or use the keyboard shortcut Ctrl+P to open the Print dialog and then select the General page (Figure 222).
4) Click Print to print the document.

**Exporting**
LibreOffice can export documents to PDF (Portable Document Format). This industry-standard file format is ideal for sending a file for someone else to view using Adobe Reader or other PDF viewers. The process and dialogs are the same for Writer, Calc, Impress, and Draw, with a few minor differences mentioned in this section.

**Directly as PDF**
Click on the Export Directly as PDF icon on the Standard toolbar to export the entire document using your default PDF settings. You are asked to enter the file name and location for the PDF file, but you cannot choose page range, image compression, or other options.

**Controlling PDF content and quality**
For more control over the content and quality of the resulting PDF:
1) Go to File > Export as PDF on the main menu bar to open the PDF Options dialog (Figure 229). Use this dialog to select the different options in the General, Initial View, User Interface, Links, and Security pages.
2) When you have selected the appropriate settings, click Export.
3) In the dialog that opens, enter the location and file name of the PDF to be created.
4) Click Save to export the file.
See the *Getting Started* guide for more information.

![PDF Options dialog](image)

**Figure 229: PDF Options dialog**

**Other formats**

LibreOffice uses the term “export” for some file operations involving a change of file type. If you cannot find what you want in **File > Save As**, look in **File > Export**. LibreOffice can export files in various formats and these are listed in the drop down list for **File format**.

To export a file in another format:

1. Specify a file name for the exported document in the **File name** text box.
2. Select the required format from the **File format** drop down list.
3. Click **Export**.

See Chapter 6 *Editing Pictures* in this guide for more information on exporting graphics.

---

**Note**

The content of the exported file will depend on the element(s) selected on the page. No selection results in the entire image being exported. For most export formats, only the image on the current page will be exported.

**Web pages**

To export a multi-page Draw document to a series of web pages, go to **File > Export** on the main menu bar and select **HTML Document** as the file type to open the HTML Export wizard. Follow the prompts to create the web pages. If required, the wizard can generate a navigation aid to help in moving from page to page.
E-mailing documents

LibreOffice provides several ways to send documents quickly and easily as an e-mail attachment in OpenDocument format (LibreOffice default format), or as a PDF. You can email a document to several recipients, for more information, see the Getting Started guide.

**Note**

Documents can only be sent from the LibreOffice menu if a mail profile has been set up.

OpenDocument format

To email the current document in OpenDocument format:

1) Go to **File > Send > Document as E-mail** on the main menu bar. LibreOffice opens your default e-mail program with the document attached.

2) In your e-mail program, enter the recipient, subject, and any text you want to add, then send the e-mail.

PDF format

To email the current document as a PDF file:

1) Go to **File > Send > E-mail as PDF** on the main menu bar. LibreOffice creates a PDF using the default PDF settings and then opens your email program with the PDF file attached.

2) In your e-mail program, enter the recipient, subject, and any text you want to add, then send the e-mail.
Chapter 11
Advanced Draw Techniques
Multi-page documents

Draw documents, like Impress presentation documents, can consist of multiple pages. This allows you to create a drawing that has several sections, but are stored as one file on a computer.

When pages are inserted into a drawing, they are automatically named as Slide 1, Slide 2, and so on. As you change page order, the pages are automatically renumbered. However, if you want to easily identify each page, then it is recommended to give each page a memorable name.

Using the page pane

By default the Page Pane (Figure 230) appears docked on the left of the workspace when you open Draw and shows every page in the drawing as a thumbnail. If the Page Pane is not displayed, go to View > Page Pane on the main menu bar.

Note

The Page Pane is called Pages when it is in its docked position on the left of the workspace.

- Select a thumbnail in the Page Pane and the corresponding page is loaded in the workspace. Click on the page in the workspace to activate it for editing. Alternatively, click on the Navigator icon or press the F5 key or go to View > Navigator on the main menu bar to open the Navigator dialog (Figure 231) and select pages using this dialog.

![Figure 230: Pages Pane and Workspace area](image)

![Figure 231: Navigator dialog](image)
• Select a thumbnail in the Page pane, then drag and drop a thumbnail to change the order of pages in the document.
• Click and drag on the separator line between the Page pane and workspace to change the width of the Page pane.
• Click on the middle of this line to show or hide the Page pane (highlighted in Figure 230).
• Press and hold the Ctrl key, then double-click in the title bar of the Page pane to undock it and turn it into a floating window.
• Press and hold the Ctrl key, then double-click in the title bar of the undocked Page pane to dock it back into its default position on the left of the workspace.
• Right-click in the page pane and, using options in the context menu, you can insert, delete or rename pages and cut, copy and paste pages.
• Go to Insert > Slide on the main menu bar to insert a new page or Insert > Duplicate Slide to insert a duplicate page.

Master pages
A master page is a page that is used as the starting point for other pages in your drawing. It is similar to a page style in Writer and controls the basic formatting of all pages based upon it. A drawing can have more than one master page so that you can assign a different to look to pages in your drawing, for example title page, contents page and drawing pages.

A master page has a defined set of characteristics, including the background color, graphic, or gradient; objects (such as logos, decorative lines, and other graphics) in the background, the formatting of text, blocks of standard text, and insert fields such as page numbering, date and filename.

Master page view
To add objects and fields to a master page, go to View > Master on the main menu bar to open the master page view. The Master View toolbar (Figure 232) also opens when you switch to master view. If this toolbar does not appear, go to View > Toolbars > Master View on the main menu bar.

To return to normal page mode, click on Close Master View in the Master View toolbar or go to View > Normal on the main menu bar.

Creating master pages
Each drawing you create already has a default master page, but you can create extra master pages to change the look of some of the pages in your multi-page drawing.

1) Go to View > Master on the main menu bar to open the master page view.

---

Note: LibreOffice uses interchangeable terms for one concept: slide master, master slide, and master page. All refer to a page which is used to create other pages. When searching for information in Draw Help, it may be necessary to use alternative search terms.
2) Click on the **New Master** icon in the Master View toolbar to create a new master page. The new master page is automatically selected allowing you to add a new set of items to create a new look for your pages.

**Renaming master pages**

Each new master page created has the default name of Default 1, Default 2, and so on. It is recommended to rename your new master page with a more meaningful name. The default master page that was created when you first created your drawing can also be renamed.

1) Go to View > Master on the main menu bar to open the master page view.
2) Right-click on a master page in the Page pane and select **Rename Page** from the context menu or click on the **Rename Master** icon on the Master View toolbar. This opens a dialog where you can type a new name.
3) Click **OK** to save the master page with its new name.

**Deleting master pages**

1) Go to View > Master on the main menu bar to open the master page view.
2) Select the master page you want to delete.
3) Right-click on a master page that you created in the Page pane and select **Delete Page** from the context menu or click on the **Delete Master** icon on the Master View toolbar.

**Note**
The delete option and delete icon are only available when there is more than master page in your drawing. You cannot delete the default master page that was created when you first created your drawing.

**Inserting fields**

You can insert fields on each master page by going to Insert > Fields on the main menu bar and selecting a field from the context menu. The following fields can be inserted into a master page.

- **Date (fixed)** – inserts the current date into your master page as a fixed field. The date is not automatically updated.
- **Date (variable)** – inserts the current date into your master page as a variable field. The date is automatically updated when you reload the file.
- **Time (fixed)** – inserts the current time into your master page as a fixed field. The time is not automatically updated.
- **Time (variable)** – inserts the current time into your master page as a variable field. The time is automatically updated when you reload the file.
- **Author** – inserts the first and last names listed in the LibreOffice user data into the active page.
- **Page Number** – inserts the page number into every page of your drawing. To change the number format, go to Format > Page on the main menu bar and select a format from the drop down list in Layout Settings.
- **File name** – inserts the name of the active file. The name only appears after you save the file.

**Assigning master pages**

When your drawing has more than one master page, you can assign different master pages to different pages.
1) Make sure you are in normal page view by going to View > Normal on the main menu bar and select the page you want to assign a new master page to it.

2) Right-click on the page in the workspace area and select Page > Slide Design from the context menu to open the Slide Design dialog (Figure 233).

3) If necessary, click Load to open the Load Slide Design dialog and use any predefined Draw or Impress master pages or templates (Figure 234).

4) If necessary, select the Exchange background page option to use the selected master page for all pages in the drawing.

5) If necessary, select the Delete unused backgrounds option to delete any master pages shown in the Slide Design dialog that have not been assigned to a page.

6) Click OK to assign the selected master page to your page.

### Multiple layers

Layers in LibreOffice Draw allow you to assemble elements on a drawing page that are related. Think of layers as individual workspaces that you can hide from view, hide from printing, or lock. Any layers that do not contain any objects are transparent.

Layers do not determine the stacking order of objects on your drawing page, except for the Controls layer which is always in front of all other layers. The stacking order of objects on your drawing page is determined by the sequence in which you add the objects. You can rearrange the stacking order by going to Modify > Arrange on the main menu bar.
You can lock a layer to protect its contents, or hide a layer and its contents from view or from printing. When you add a new layer, the layer is added to all of the pages in your drawing. However, when you add an object to a layer, it is only added to the current drawing page.

If you want the object to appear on all of the pages (for example, a company logo), add the object to the master page by going to View > Master. To return to your drawing, go to View > Normal.

### Default layers

LibreOffice Draw provides three default layers and these default layers cannot be deleted or renamed.

- **Layout** – is the default workspace and determines the location of title, text and object placeholders on your drawing page.
- **Controls** – used for buttons that have been assigned an action, but should not be printed and the layer properties are set to not printable. Objects on this layer are always in front of objects on other layers.
- **Dimension Lines** – is where the dimension lines are drawn. By switching the layer to show or hide, you can easily switch dimension lines on and off.

### Inserting layers

1) Right-click the layer tab area at the bottom left of the Workspace area and select Insert Layer from the context menu, or go to Insert > Layer on the main menu bar to open the Insert Layer dialog (Figure 235).

![Insert Layer dialog](image)

**Figure 235: Insert Layer dialog**

2) Type meaningful names for the layer in the Name and Title text boxes.
3) If necessary, type a description for the layer in the Description text box.
4) Select Visible if you want the layer to be visible in your drawing. When Visible is not selected, a layer is hidden and the title in the layer tab changes color to blue.
5) Select Printable if you want the layer to print when you print your drawing. Not printing is useful if you want use a draft layer for guides or annotations that you use in making the drawing, but do not want to appear in the final output.
6) Select **Locked** to prevent any objects on this layer from deletion, editing, or moving. No additional objects can be added to a locked layer. Locking a layer is useful, for example, when a base plan is to be protected while adding a new layer with other details.

7) Click **OK** and the new layer automatically becomes active.

### Modifying layers

1) Right-click on the name tab of the layer and select **Modify Layer** from the context menu or double-click on the name tab to open the **Modify Layer** dialog. This dialog is similar to the Insert Layer dialog in Figure 235.
2) Make your changes to the layer, then click **OK** to save the changes and close the dialog.

### Working with layers

#### Selecting a layer

To select a layer, click on the name tab of the layer at the bottom of the drawing workspace.

#### Hiding layers

1) Select a layer, and right-click on the name tab of the layer and select **Modify Layer** from the context menu or double-click on the name tab to open the **Modify Layer** dialog.
2) Clear the **Visible** check box and click on the **OK** button. The text on the name tab changes color to blue. Any objects placed on a hidden layer will no longer be visible on the other layers in your drawing.
3) Alternatively, hold down the **Shift** key and click on the name tab to hide the layer.

#### Showing hidden layers

1) Select a hidden layer, and right-click on the name tab of the layer and select **Modify Layer** from the context menu or double-click on the name tab to open the **Modify Layer** dialog.
2) Check the **Visible** check box and click **OK**. The text for the name tab changes to the default color for text for your computer setup. Any objects placed on a hidden layer will now become visible on the other layers in your drawing.
3) Alternatively, hold down the **Shift** key and click on the name tab to make the layer visible.

#### Locking layers

1) Select a layer, and right-click on the name tab of the layer and select **Modify Layer** from the context menu or double-click on the name tab to open the **Modify Layer** dialog.
2) Check the **Locked** check box and click **OK** to prevent any modification of the layer.

#### Unlocking layers

1) Select a layer, and right-click on the name tab of the layer and select **Modify Layer** from the context menu or double-click on the name tab to open the **Modify Layer** dialog.
2) Uncheck the **Locked** check box and click **OK** to allow modification of the layer.

#### Renaming layers

1) Right-click on the name tab of the layer and select **Rename Layer** from the context menu.
2) Type a new name for your layer and click outside the tab area to save the change.
3) Alternatively, follow the procedure in “Modifying layers” above to rename the layer.
Deleting layers

1) Right-click on the name tab of the layer and select **Delete Layer** from the context menu.
2) Confirm the deletion and the layer and all its objects are deleted.

**Note**
You can only delete layers that you have added to your drawing. The default layers, Layout, Controls and Dimensioning, cannot be deleted.

Dimensioning

Draw allows you to dimension objects and display these dimensions to make your drawing look more like an engineering drawing. When you create dimensions, they are automatically placed on the **Dimension Lines** layer (see “Default layers” on page 198 for more information).

Configuring dimensioning

Two ways are available to access the options to configure dimensioning. Both methods use a similar dialog to set the dimensioning options where you can change length, measurement and guide properties of a dimension line.

Graphic styles

1) Go to **Format > Styles and Formatting** on the main menu bar or press the **F11** key on your keyboard to open the **Styles and Formatting** dialog.
2) Select **Dimension Line** in the Styles and Formatting dialog.
3) Right-click on **Dimension Line** and select **Modify** from the context menu to open the **Graphics Styles** dialog (Figure 236). See the **Impress Guide** for more information about graphic styles.

![Figure 236: Graphic Styles Dimensioning dialog](image)
4) Click on the **Dimensioning** tab to open the **Dimensioning** options page.
5) Make the changes you want to use for dimensioning using the various options on this page.
6) Click **OK** to save your changes and close the dialog.
7) To reset the dimensioning options to the default properties of the template, click **Standard**.

**Context menu**
1) Draw a dimension line. See “Dimensioning objects” on page 202 for more information.
2) Right-click on the dimension line and select **Dimensions** from the context menu to open the **Dimensioning** dialog (Figure 237).
3) Make the changes you want to use for dimensioning using the various options on this dialog.
4) Click **OK** to save your changes and close the dialog.

![Figure 237: Context menu Dimensioning dialog](image)

**Dimensioning dialog**
With reference to Figure 236 and Figure 237, the dimensioning options are as follows.

- **Line** – sets the distance properties of the dimension line and the guides with respect to each other and to the baseline.
  - **Line distance** – specifies the distance between the dimension line and the baseline (line distance = 0).
  - **Guide overhang** – specifies the length of the left and right guides starting at the baseline (line distance = 0). Positive values extend the guides above the baseline and negative values extend the guides below the baseline.
  - **Guide distance** – specifies the length of the right and left guides starting at the dimension line. Positive values extend the guides above the dimension line and negative values extend the guides below the dimension line.
  - **Left guide** – specifies the length of the left guide starting at the dimension line. Positive values extend the guide below the dimension line and negative values extend the guide above the dimension line.
- **Right guide** – specifies the length of the right guide starting at the dimension line. Positive values extend the guide below the dimension line and negative values extend the guide above the dimension line.
- **Measure below object** – reverses the properties set in the Line options.
- **Decimal places** – specifies the number of decimal places used for the display of line properties.
- **Legend** – sets the properties of the dimension text.
  - **Text position** – determines the position of the dimension text with respect to the dimension line and the guides. The AutoVertical and AutoHorizontal checkboxes must be cleared before you can assign a text position.
  - **AutoVertical** – determines the optimal vertical position for the dimension text.
  - **AutoHorizontal** – determines the optimal horizontal position for the dimension text.
  - **Parallel to line** – displays the text parallel to or at 90 degrees to the dimension line.
  - **Show meas. units** – shows or hides the dimension measurement units. You can also select a measurement unit you want to display from the list.

**Note**
The dimensioning style Dimension Line is always linked and stored with the current work page. All the changes that you make apply only to this page. New drawings are started with the standard properties of Draw. If you want to use the amended style for future drawings, save your drawing as a template.

**Tip**
When dimensioning objects, it is recommended to use the zoom function, guide lines and snap functions so that you can accurately place dimension lines on an object. See *Chapter 3 Working with Objects and Object Points* for more information.

**Dimensioning objects**

![Dimensioning objects diagram](image)

1) Click on the small triangle next to the **Lines and Arrows** icon on the Drawing toolbar to open the Arrows pop-up toolbar. Note that this icon changes depending on the last Lines and Arrows tool used. Also, this toolbar can become a floating toolbar by clicking on the bottom of the pop-up toolbar and dragging it into your workspace.

2) Click on the **Dimension Line** icon on the Arrows toolbar and the cursor normally changes to a cross. This depends on your computer setup.

3) Position the cursor at one corner of your object, then click and drag the cursor to the other corner of your object to draw the dimension line. To restrict drawing your dimension line in the horizontal or vertical direction, press and hold the **Shift** key while dragging the cursor.
4) Release the mouse button when you reached the other corner of your object and the dimension line is drawn with the dimension automatically added. The dimension line is also placed automatically on the **Dimension Lines** layer; see “Default layers” on page 198 for more information.

5) If you want to edit the text of the dimension, double-click on an unselected dimension line to enter text edit mode and make your changes. Click outside the dimension line to save the changes.

6) If you want to configure your dimension line, see “Configuring dimensioning” on page 200.

**Drawing to scale**

In Draw a drawing is made on a predefined drawing area. This is normally Letter or A4 page size depending on your locale, computer setup and the default printer connected to your computer. However, depending on the actual size of the drawn objects, it is often convenient to reduce or enlarge the drawing by scaling (for example 1:10 or 2:1).

You can specify a scale value by going to **Tools > Options > LibreOffice Draw > General** and selecting a value from the **Drawing scale** drop down list. The default setting for this option is 1:1. When you make a change to the drawing scale, it is reflected in the rulers at the top and left side of your drawing.

Any change in the drawing scale has no effect on the basic drawing operations. Draw automatically calculates the necessary values (for example, dimension lines). The spacing of the grid points is independent of drawing scale as the grid is an optical drawing aid and not a drawing element.

An increase in scale (for example 1:4) allows you to draw objects that would not fit into the paper size for your drawing. A decrease in drawing scale (for example 4:1) allows you to draw small objects accurately at an increased size to make them easier to understand. An example of drawing to scale is shown in Figure 239. All three rectangles are the same size.

- The left rectangle was drawn at the default 1:1 scale and dimensioned.
- The drawing scale was then changed to 1:4 and the dimensions were automatically increased by Draw to reflect the decrease in scale for the center rectangle.
- The drawing scale was then changed to 4:1 and the dimensions were automatically decreased by Draw to reflect the increase in scale for the right rectangle.

![Figure 239: Examples of drawing to scale](image)

**Gallery images**

Draw includes several images in a **Gallery** which are grouped in themes: **Bullets; Rulers; Homepage; Rulers; Sounds**. The left pane of the gallery window lists the available themes. Click on a theme to see its images displayed in the right pane of the **Gallery** dialog (Figure 240).
The default themes are read only; no images can be added to or deleted from these themes. The default themes are easily recognizable by right-clicking on each category and the only available option in the pop-up menu is **Properties**.

In a default installation of LibreOffice, the *My themes* is the only category that is customizable and allows you add or delete your own graphics. You can also create new theme categories where you can add or delete your own images and this is explained in “Adding a new theme” on page 206.

**Using the Gallery**

1) Click on the Gallery icon on the Drawing toolbar or go to **Tools > Gallery** on the main menu bar to open the Gallery dialog.
2) Choose a theme in the left pane of the Gallery dialog.
3) Click on an image in the right pane of the Gallery dialog and drag the image into your drawing.
4) Alternatively, right-click on a gallery image and select **Insert > Copy** from the context menu.
5) Move to your drawing and paste the gallery image into your drawing.

**Adding images to My themes**

You can only add images to *My themes* or themes that you have created.

1) Right-click on *My themes* or a theme name that you created in the list of theme categories and choose **Properties** from the pop-up menu to open the **Properties of My Theme** dialog (Figure 241).
2) Click on the **Files** tab.
3) Click on **Find Files** to open the **Select Path** dialog (Figure 242).
4) Browse to the folder that contains the images you want to use.
5) Click **OK** to select the files contained in the folder and the **Select Path** dialog closes. The list of files contained in the folder now appear in the Theme Properties dialog.
6) Select the files you want to use in *My themes* and click on **Add**. The added files will disappear from the file list and the images will appear in the Gallery.
7) If you want to add all the files in the list, click **Add All**. All the files will disappear from the list and the images will appear in the Gallery.
8) Click **OK** when finished and the **Properties of My Theme** dialog will close.
Deleting graphics
You can only delete images from *My themes* or themes that you have created.

1) Right-click on the image in the Gallery window.
2) Choose **Delete** from the pop-up menu.
3) A confirmation message appears, asking if you want to delete this object. Click **Yes**.

| Note | The image is a linked file and is deleted from the Gallery only. The original image file is not deleted. |
Updating the Gallery

All the images in a gallery are linked files. From time to time it is beneficial to update My Theme or a theme you have created to make sure that all the files are still there. To do so, right-click on the theme where you have added at least one file and then select Update from the context menu.

Adding a new theme

You can add a new theme to the list of theme categories in the gallery as follows:

1) Click the New Theme button above the list of theme categories and the Properties dialog opens.
2) Click the General tab and type a name for the new theme in the text box (Figure 243).
3) Click the Files tab and follow Steps 3 through to 8 in “Adding images to My themes” on page 204.
4) The new theme will now be displayed in the list of theme categories in the Gallery.

![Properties of New Theme](image)

Figure 243. Adding new theme to the Gallery

Note

If you wish, you can rename this new theme by manually by right-clicking the theme name and selecting Rename.

Color and color palettes

Draw (like all LibreOffice components) uses color palettes for the representation of colors. You can customize the color palette to suit your own needs by modifying colors in a palette, adding other colors, or creating new color palettes.

Note

LibreOffice uses the RGB color model internally for printing in all of its software modules. The CMYK controls are provided only to ease the input of color values using CMYK notation.
Using colors

Two color dialogs are available where you can select, add, modify, edit or delete colors. Go to **Tools > Options > LibreOffice > Colors** (Figure 244) or **Format > Area > Colors** (Figure 245) on the main menu bar to open these color dialogs. Also, if you right-click on a selected object and go to **Area** in the context menu, then click on the **Colors** tab you will open the **Area** dialog in Figure 245.

![Figure 244: Options – LibreOffice – Colors dialog](image)

![Figure 245: Format Area Colors dialog](image)

Each color value has a numeric value and can be input directly as numbers. The color values for the RGB color model (Red, Green and Blue) can be any integer value between 0 and 255. The color values for the CMYK color model (Cyan, Magenta, Yellow and Black (K)) are percentages. When selecting between the RGB and CMYK color models in both dialogs, the value boxes automatically change to show RGB or CMYK.
When using CMYK values, the conversion to RGB values used in LibreOffice is made automatically. Any modifications made to colors apply only to the active palette in your drawing unless you save the modified color palette for future use.

**Tip**  

### Selecting colors

1. Go to **Tools > Options > LibreOffice > Colors** (Figure 244) or **Format > Area > Colors** (Figure 245) on the main menu bar to open a color dialog.
2. Alternatively, right-click on a selected object and select **Area** from the context menu, then click on the **Colors** tab to open the color dialog (Figure 245).
3. Select a color from the **Color** drop down list, or select a color from the color table, or enter the RGB or CMYK values if you know these values for the color you want to use.
4. Click **OK** to use the selected color and close the dialog.

### Color palettes

Using the **Format > Area Colors** dialog (Figure 245) allows you to load color palettes and create then save color palettes for future use.

- Click on the **Load Color List** icon to open a dialog where you can select a color palette to use in Draw.
- If you have made any changes to the color palette, click on the **Save Color List** icon to open a dialog where you can save your color palette for future use in Draw. The file format used in LibreOffice for color palettes is .soc.

**Note**  
The **Load Color List** and **Save Color List** icons are only available if you select the color dialog using the **Format > Area > Colors** command or right-clicking on a selected object and selecting **Area** from the context menu.

### Creating colors

#### Using color values

1. Select either RGB or CMYK from the drop-down options on the color dialog.
2. Enter integer values or percentage values in each of the RGB or CMYK boxes or use the spinners at the right of each box.
3. The original color is shown the top color sample and the new color is shown in the lower color sample.
4. Either, click **Modify** to apply and store the new setting in the color palette without changing the color name.
5. Or, click **Add** and you will be prompted to give the color a new name. Entering a new name and clicking **OK** will add the new color to the end of the color list and store it in the currently active palette.
6. Click **OK** to use the modified or new color and close the dialog.

**Note**  
To store your new color in a color palette for future use in Draw, see “Color palettes” on page 208.
Using the color picker

You can define colors using the Color Picker dialog (Figure 246).

1) Go to Format > Area > Colors on the main menu bar or right-click on a selected object and go to Area in the context menu to open the Area dialog and then click on the Colors tab to open the colors dialog (Figure 245).
2) Click Edit to open the Color Picker dialog where you will have three ways of selecting a color to create and use.
3) Click on the colored bar to the right of the color sample area to select a color. The values in the RGB, HSB (Hue, Saturation and Brightness) and CMYK boxes will change.
4) Or, enter values in either the RGB, HSB or CMYK boxes to create the color. Entering values in one set of value boxes will change the values in the other two sets of boxes.
5) Or, click on the small circle in the color sample area and drag it to a new position to create a new color.
6) The color bar below the sample color area will show the new color on the left half of this bar so that you can compare it with the original color on the right half of this bar.
7) If you are satisfied with the color created, click OK to use the color.
8) See “Using color values” on page 208 to save the color.

Deleting colors

1) To delete a color from a color palette, open the color dialog (Figure 244 or Figure 245).
2) Select the color from the Color drop down list or the color table and click Delete.
3) Click Yes to confirm the deletion of the color.
4) Click OK to close the color dialog.

Bézier curves

In LibreOffice you can use Bézier curves in your drawing. A curve is defined by means of a start point $P_0$, an end point $P_3$, and two control points $P_1$ and $P_2$ (Figure 247). For points on the curve the
terms *nodes* or *anchors* are often used. For the mathematical background of Bézier curves, see [http://en.wikipedia.org/wiki/Bezier_curve](http://en.wikipedia.org/wiki/Bezier_curve).

![Figure 247: Points in Bézier curves](image)

Bézier curves are very useful for experimenting with the shape and form of curves. In point mode you can change the curve alignment by dragging the points with the mouse. The curve leaves the start point $P_0$ in the direction of the control point $P_1$ and arrives at the end point $P_3$ from the direction of the control point $P_2$. The more distant a control is from its start or end point the smaller the curvature at that point. If a control point lies directly on one of these points, it has no influence on the curve.

### Drawing a Bézier curve

1) Click on the small triangle to the right of the Curve icon on the Drawing toolbar to open the Lines toolbar (Figure 248). The Curve icon will show the last tool selected from the Lines toolbar. To make this toolbar a floating toolbar, click at the bottom of the pop-up toolbar and drag it onto your workspace.

![Figure 248: Lines toolbar](image)

2) Click on the Curve icon on the Lines toolbar. Note that this maybe a different icon to the Curve icon on the Drawing toolbar.

3) Click at the start point where you want to draw the curve and, keeping the mouse button pressed, drag the cursor to the approximate the position of the end point for the curve.

4) Double-click when you have reached the end position of your curve and a curve is drawn. The arc of the curve is determined by the distance you have dragged to create the end point.

---

**Note**

If you single click when you have reached the end point of your curve, you will continue drawing straight lines until you double-click to end the drawing of a curve.

---

5) Click on the Points icon on the Drawing toolbar or press the $F8$ key to open the Edit Points toolbar (Figure 249).

6) Click once on your curve to display the start and end points. The start point of the curve is larger than the end point.

7) Move cursor over the start or end point and drag the control point to its correct position, if necessary. As you drag a start or end point, a control point appears at the end of a dashed line connected to the point you have selected (Figure 250).

210  
*LibreOffice 4.1 Draw Guide*
8) When you have the position for your start or end point, release the cursor and the control point remains active.

9) Click on the control point and drag it to change the shape of the curve.

10) When you have finished editing your curve, click anywhere on your workspace to deselect the curve and stop editing points.

**Edit Points tools**

With reference to Figure 249, the tools available on the **Edit Points** toolbar allow you to edit and change the shape of a Bézier curve and are explained as follows:

- **Points** – allows you to activate or deactivate the edit mode for Bézier objects. In the edit mode, individual points of the drawing object can be selected.

- **Move Points** – activates a mode in which you can move points. The mouse pointer displays a small empty square when resting on a point. Drag that point to another location. The curve on both sides of the point follows the movement; the section of the curve between points changes shape. Point at the curve between two points or within a closed curve and drag the mouse to shift the entire curve without distorting the form.

- **Insert Points** – activates the insert mode and allows you to insert points. You can also move points, just as in the move mode. If, however, you click at the curve between two points and move the mouse a little while holding down the mouse button you insert a new point. The point is a smooth point, and the lines to the control points are parallel and remain
so when moved. If you wish to create a corner point you must first insert either a smooth or a symmetrical point which is then converted to a corner point by using **Corner Point**.

- **Delete Points** – used to delete one or several selected points. If you wish to select several points click the appropriate points while holding down the *Shift* key. First select the points to be deleted, and then click this icon or press *Delete* key.

- **Split Curve** – this tool splits a curve. Select the point or points where you want to split the curve, then click.

- **Convert To Curve** – converts a curve into a straight line or converts a straight line into a curve. If you select a single point, the curve before the point will be converted. If two points are selected, the curve between both points will be converted. If you select more than two points, each time you click this icon, a different portion of the curve will be converted. If necessary, round points are converted into corner points and corner points are converted into round points. If a section of the curve is straight, the end points of the line have a maximum of one control point each. They cannot be modified to control points unless the straight line is converted back to a curve.

- **Corner Point** – converts the selected point or points into corner points (Figure 251). Corner points have two movable control points, which are independent from each other. A curved line, therefore, does not go straight through a corner point, but forms a corner.

![Figure 251: Corner point](image)

- **Smooth Transition** – converts a corner point or symmetrical point into a smooth point (Figure 252). Both control points of the corner point are aligned in parallel and can only be moved simultaneously. The control points may differentiate in length, allowing you to vary the degree of curvature.

![Figure 252: Smooth transition point](image)

- **Symmetric Transition** – converts a corner point or a smooth point into a symmetrical point (Figure 253). Both control points of the corner point are aligned in parallel and have the same length. They can only be moved simultaneously and the degree of curvature is the same in both directions.

![Figure 253: Symmetric transition point](image)

- **Close Bézier** – closes a line or a curve. A line is closed by connecting the last point with the first point, indicated by an enlarged square.
• **Eliminate Points** – marks the current point or the selected points for deletion. This happens when the point is located on a straight line. If you convert a curve or a polygon with the Convert to Curve tool into a straight line or you change a curve with the mouse so that a point lies on the straight line, it is removed. The angle from which the point reduction is to take place can be set by going to Tools > Options > LibreOffice Draw > Grid.

**Adding comments to a drawing**

Draw supports comments similar to those in Writer and Calc.

1) Go to Insert > Comment the main menu bar. A comment box appears with a small marker box containing your initials in the upper left-hand corner of your drawing. Draw automatically adds your name and the date at the bottom of the comment (Figure 254).

2) Type or paste your comment into the text box.

3) To apply basic formatting to the text, right-click and select the formatting option from the context menu.

4) To delete a comment, right-click on the comment or marker box and select an option from the context menu or click on the small triangle in the bottom right of the comment and select an option from the context menu.

5) To move a comment, click on the small marker box and drag it to a new position on your drawing.

6) To show or hide the comments, go to View > Comments.

![Figure 254: Comment in a drawing](image)

**Note**

For your initials and name to appear in a comment, you have to enter your user data. Go to Tools > Options > LibreOffice > User Data and enter all the necessary data. If more than one person edits the document, each author is automatically allocated a different background color.

**Connecting and breaking lines**

It is possible in Draw to connect separate line elements together making one line, break a line that is composed of separate elements.

Select a number of lines and go to Modify > Connect on the main menu bar. The lines are converted to curves and adjacent end points are joined together. The resulting shape is a polyline, not a closed shape.

Select a line that is composed of separate elements and go to Modify > Break. Each separate element is now indicated with start and end points. Click on an element and drag it to a new position.
Our apologies that this book has no index. It is produced by volunteers from the LibreOffice community, and no one among the volunteers has updated the index. Our choices were to have no index or to delay publication for so long that it would be very out of date. We decided that “no index” was the best choice.
Draw Guide

Working with vector graphics

About this book:
This book cover the main features of Draw, the vector graphics component of LibreOffice. Using Draw, you can quickly create a wide variety of graphical images. Vector graphics store and display a picture as simple geometric elements such as lines, circles, and polygons rather than as a collection of pixels (points on the screen). This permits simpler storage and supports precise scaling of the picture elements. Draw is fully integrated into Libre-Office. This simplifies exchanging graphics with Writer, Calc, and Impress. You can also export images in many formats for use in other programs.

About the authors:
This book was written by volunteers from the LibreOffice community. Profits from sales of the printed edition will be used to benefit the community.

A PDF version of this book can be downloaded free from http://libreoffice.org/get-help/documentation/

About LibreOffice:
LibreOffice is the free, libre, and open source personal productivity suite from The Document Foundation. It runs on Windows, Macintosh, and GNU/Linux. Support and documentation is free from our large, dedicated community of users, contributors, and developers. You too can get involved with volunteer work in many areas: development, quality assurance, documentation, translation, user support, and more.

You can download LibreOffice free from http://libreoffice.org/download/
