Using LibreOffice on macOS

Some keystrokes and menu items are different on macOS from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this document. For a detailed list, see the application Help.

<i>Windows or Linux</i>	<i>macOS equivalent</i>	<i>Effect</i>
Tools > Options menu selection	LibreOffice > Preferences	Access setup options
Right-click	<i>Control</i> +click or right-click depending on computer setup	Open a context menu
<i>Ctrl</i> (Control)	⌘ (Command)	Used with other keys
<i>Alt</i>	⌥ (Option) or <i>Alt</i> , depending on keyboard	Used with other keys
<i>F11</i>	⌘+T	Open Styles deck in Sidebar

Introduction

Tables are a useful way to organize and present large amounts of information, for example:

- Technical, financial, or statistical reports.
- Catalogs showing descriptions, prices, characteristics, and photographs of products.
- Bills or invoices.
- Lists of names with address, age, profession, and other information.

Tables can often be used as an alternative to spreadsheets to organize materials. A well-designed table can help readers understand better what you are saying. While you would normally use tables for text or numbers, you could put other objects, such as pictures, in cells. Writer's tables provide limited spreadsheet functions; see "Using spreadsheet functions in a table" on page 24.

Tables can also be used as a page-layout tool to position text in areas of a document instead of using several Tab characters. Another example is in headers and footers to support independent positioning of different elements, such as page number, document title, and so on. This use of tables is described in Chapter 6, Formatting Pages: Advanced.

Tools for working with tables

All of the table commands described in this chapter are conveniently located under **Table** on the Menu bar (Figure 1) and on the Table toolbar (Figure 2). Some are also found in the context menu for a table or in the Table panel of the Properties deck in the Sidebar (Figure 3).

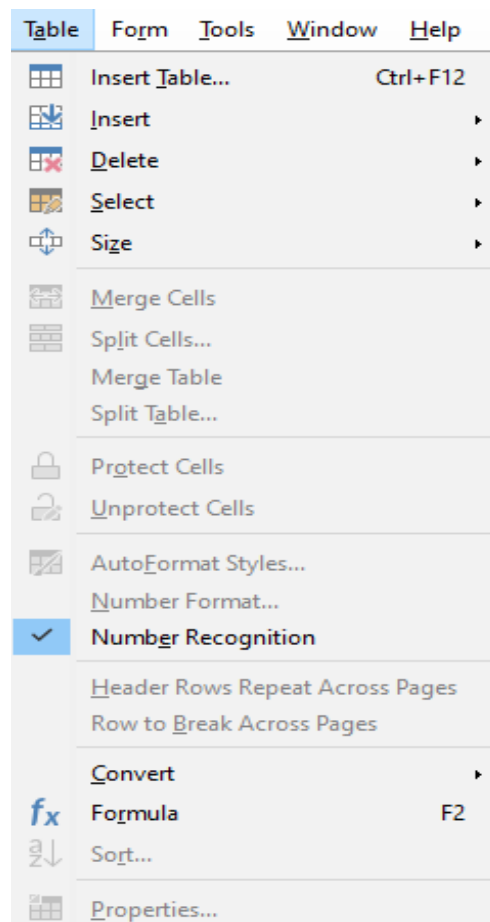

Figure 1: The Table menu

When you create a table or select an existing table, the Table toolbar (Figure 2) is displayed automatically. You can manually display it at any time by clicking **View > Toolbars > Table**. The toolbar can float over the main Writer window, or it can be docked along any edge of the main window. See Chapter 1, *Introducing Writer*, for more about docking and floating toolbars, and how to hide and display specific tools on a toolbar.

Figure 2: The Table toolbar

1	Rows Above	12	Split Table	23	Number Format: Percent
2	Rows Below	13	Optimize Size	24	Number Format: Decimal
3	Columns Before	14	Align Top	25	Number Format
4	Columns After	15	Center Vertically	26	Insert Caption
5	Delete selected rows	16	Align Bottom	27	Sort
6	Delete selected columns	17	Table Cell Background Color	28	Protect Cells
7	Delete table	18	AutoFormat Styles	29	Unprotect Cells
8	Select Cell	19	Borders	30	Sum
9	Select Table	20	Border Style	31	Insert Text Formula
10	Merge Cells	21	Border Color	32	Table Properties
11	Split Cells	22	Number Format: Currency		

When the cursor is in a table, the Properties deck in the Sidebar (Figure 3) includes table properties.

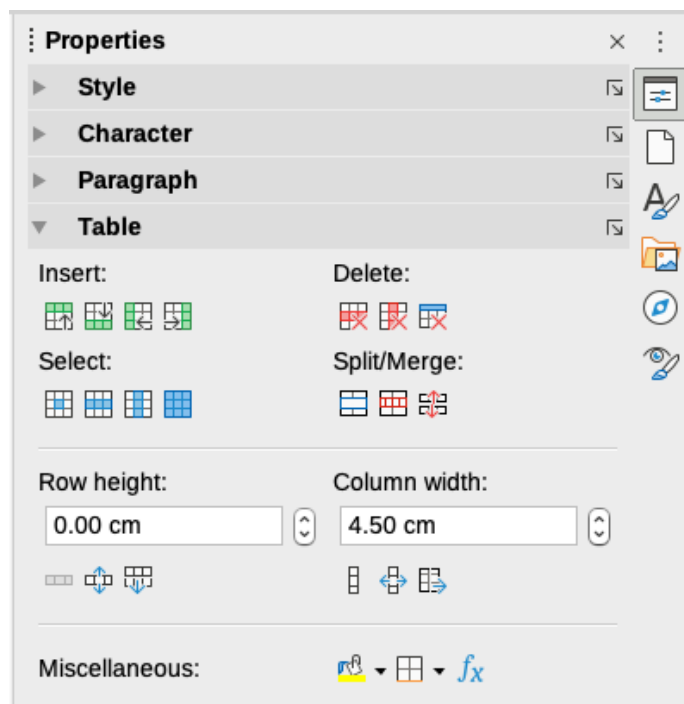

Figure 3: Table properties in Sidebar

Creating a table

Before you create a table in a Writer document, it helps to have an idea of the visual result you want and an estimate of the number of rows and columns required. Every parameter can be changed at a later stage; however, thinking ahead can save time as changes to fully formatted tables often require a significant effort.

Creating a new table

To quickly create a table with the default properties, click the **Insert Table** icon on the Standard toolbar. On the drop-down graphic, choose the size of the table (up to fifteen rows and up to ten columns). To create the table, click the cell that you want to be on the last row of the last column.

Figure 4: Inserting a table

To create a new table and specify the properties for the table, position the cursor where you want the table to appear, then use any of the following methods to open the Insert Table dialog:

- Choose **Table > Insert Table** on the Menu bar.
- Press *Ctrl+F12*.
- On the Standard toolbar, click the **Insert Table** icon and select **More Options** at the bottom of the drop-down graphic.

In the *General* section of the Insert Table dialog (Figure 5), in the *Name* box, you can enter a different name from the Writer-generated default for the table. This might come in handy when using the Navigator to jump quickly to a table.

In the *Columns* and *Rows* boxes, specify the number of columns and rows for the new table. You can change the size of the table later, if necessary.

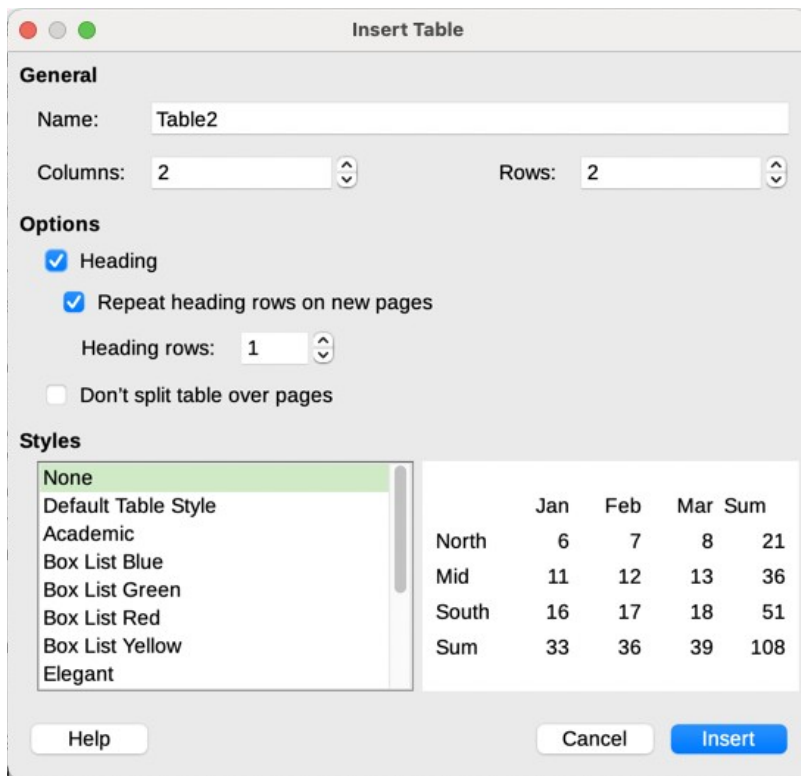

Figure 5: Insert Table dialog

Under *Options*, set up the initial table characteristics:

- **Heading** — Enables a heading to be used in the table and defines the number of rows to be used as headings. A second (and, occasionally, third) heading row can be useful for sub-headings in a complex table.

The default Table Heading paragraph style is applied to the heading rows. You can edit the Table Heading paragraph style to change these default settings.

- **Repeat heading rows on new pages** — Enables the heading rows to be repeated at the top of subsequent pages if the table spans more than one page.
- **Heading rows** — Specifies the number of rows to be used for the heading. Default is 1.
- **Don't split table over pages** — Prevents the table from spanning more than one page. This can be useful if the table starts near the end of a page, and would look better if it were completely located on the following page. If the table starts earlier on the page but does not all fit, this setting can lead to awkward page breaks. If the table becomes longer than would fit on one page, either deselect this option or manually split the table.

The *Styles* section lists several predefined table layouts, also known as table styles. See “Creating and applying table styles” on page 19 for more information. You can select and preview the desired table option from the list.

After making your choices, click **Insert**. Writer creates a table as wide as the text area (from the left page margin to the right page margin), with all columns the same width and all rows the same height. You can adjust the columns and rows later to suit your needs.

Creating nested tables

You can create tables within tables, nested to a depth limited only by imagination and practicality. Nested tables are especially useful for page layout. Figure 6 demonstrates a simple, two-level example. The shaded table is inside a cell of the larger table. To achieve this, simply click in a cell of an existing table and use any of the methods mentioned in “Creating a new table” above.

Figure 6: Nested table example

Using AutoCorrect to create a table

You can also create a table by typing a series of hyphens (-) or tabs separated by plus signs. Use the plus signs to indicate column dividers, while hyphens and tabs are used to indicate the width of a column. When using tabs, the default tab setting determines the width; this setting can be changed in **Tools > Options > LibreOffice Writer > General**.

For example, this character sequence:

```
+-----+-----+-----+
```

creates a table like this:

--	--	--

✓ Note

This function can be disabled or enabled in **Tools > AutoCorrect > AutoCorrect Options**. On the *Options* page, deselect or select **Create table**.

Creating a table from formatted text

You can create a table from formatted text by using **Table > Convert > Text to Table** on the Menu bar. The text to be converted must contain characters to indicate column separators. Paragraph marks indicate an end of a table row.

i Tip

Unlike the creation of a table by other methods, conversion from text to table preserves the paragraph style and character style applied to the original text.

- 1) Start by editing the text, if necessary, to ensure the column separator character is where you want it. Select the text you want to convert and choose **Table > Convert > Text to Table** to open the dialog shown in Figure 7.
- 2) The *Separate text at* section has four options for the separator for the columns of text. Select **Other** to choose the default comma (useful if you are importing a .csv file) or type any character in the box.
The *Options* are the same as those in the Insert Table dialog (Figure 5).
- 3) Click **OK** to convert the text.

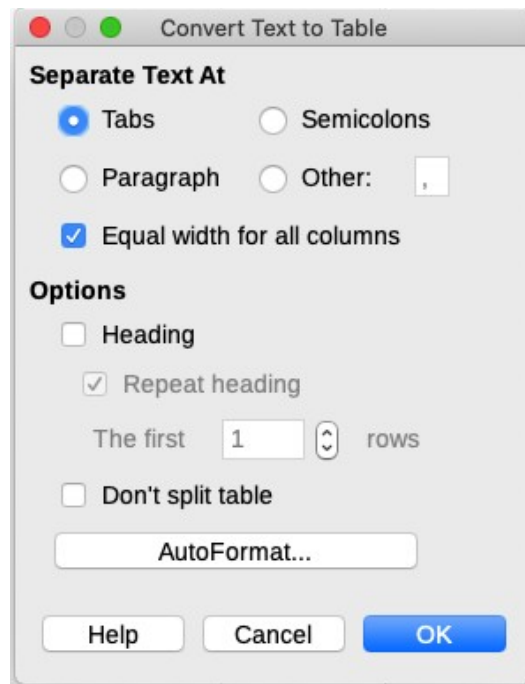

Figure 7: Dialog for text to table conversion

Example

In this example we will convert the following text into a table.

```
Row 1 Column 1; Row 1 Column 2; Row 1 Column 3
Row 2 Column 1; Row 2 Column 2; Row 2 Column 3
```

In this case, the separator between elements is a semicolon. Select the text and choose **Table > Convert > Text to Table**. We obtain the following result.

Row 1 Column 1	Row 1 Column 2	Row 1 Column 3
Row 2 Column 1	Row 2 Column 2	Row 2 Column 3

Tip

You can also perform the opposite operation, to transform a table into plain text. This may be useful when you want to export the table contents into a different program.

To transform a table into text, place the cursor anywhere in the table, choose **Table > Convert > Table to Text** on the Menu bar, pick the preferred row separator, and click **OK** to finish.

Inserting a portion of a spreadsheet

To copy a spreadsheet area into a Writer document as a Writer table:

- 1) Open both the Writer document and the spreadsheet.
- 2) Select the sheet area (cells) that you want to copy.
- 3) Right-click and choose **Copy** in the context menu, or press *Ctrl+C*; then click in the Writer document and choose **Paste** in the context menu or press *Ctrl+V*. Or, drag the area into the Writer document.

See also Chapter 19, Spreadsheets, Charts, Other Objects, for other methods of inserting spreadsheets into Writer documents.

Formatting the table layout

Formatting a table is a two-step process: formatting the table layout (the subject of this section) and formatting the table text (the subject of the next section).

Tip

If you apply similar formatting of table layout and table text to multiple tables, using table styles can speed up your work and provide consistency. See “Creating and applying table styles” on page 19.

Formatting the layout normally involves one or more of the following operations: adjusting the size of the table and its position on the page, adjusting sizes of rows and columns, adding or removing rows or columns, merging and splitting individual cells, changing borders and background.

Default parameters

If you create a table using the Insert Table dialog or the Insert Table icon on the Standard toolbar, the following defaults are set:

- The cells use the Table Contents paragraph style. In the default template, this style is identical to the Default Paragraph Style.
- The default table occupies all the space from margin to margin (text area).
- The default table has thin black borders around each cell (grid).
- If you activate the Heading option, the cells in the heading row (or rows) use the Table Heading paragraph style.

Resizing and positioning the table

Using the default settings, any newly created table will occupy the entire width of the text area. This is sometimes what you want, or you may prefer a smaller table. To quickly resize a table, first move the mouse to either the left or right edge. When the cursor changes shape into a double arrow, drag the border to the new position. This operation only changes the size of the first or last column; it does not change the alignment of the table on the page.

For more precise control over the size and position of the table on the page, open the Table Properties dialog (Figure 8) by choosing **Table > Properties** or by right-clicking anywhere in the table and choosing **Table Properties** in the context menu.

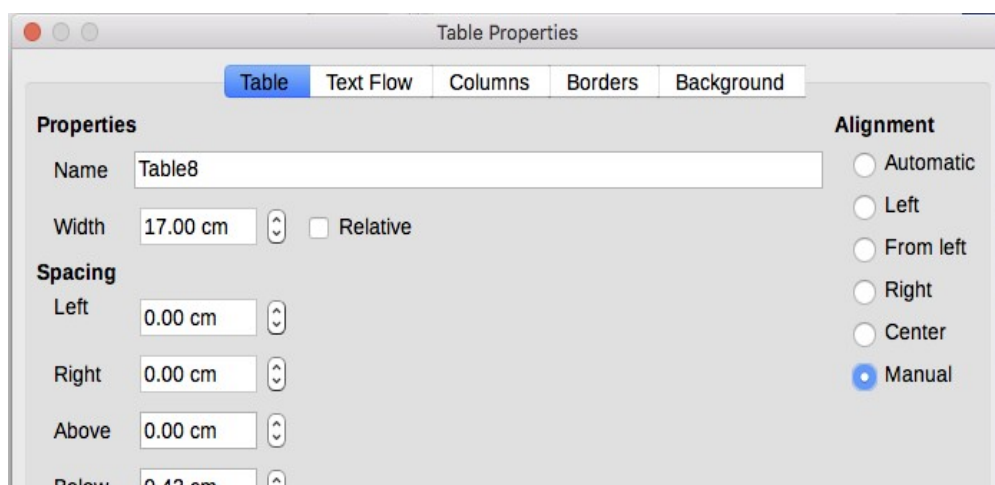

Figure 8: Table Properties dialog: Table tab

On the *Table* tab of the dialog (Figure 8), you can set the alignment of the table:

- **Automatic:** the default setting for a table, fills the width of the text area.
- **Left:** aligns the table with the left margin.
- **Right:** aligns the table with the right margin.
- **From Left:** lets you specify under *Spacing* exactly how far from the left margin the table is placed.
- **Center:** aligns the table in the middle between the left and right margins. If the table width is greater than the margin, the table will extend outside of the margins.
- **Manual:** lets you specify the distances from both left and right margins under *Spacing*.

Selecting an alignment option other than Automatic activates the *Width* field in the *Properties* section, where you can enter the desired size of the table. Select **Relative** to see the width as percentage of the text area.

In the *Spacing* section, use the *Above* and *Below* boxes to modify the separation between the text and the table.

When the size of the table is less than the size of the text area, Writer will insert some values in the *Left* and *Right* boxes. Otherwise these values are not available. You can enter values:

- In both the *Left* and *Right* boxes if you select **Manual** alignment.
- In the *Left* box when you select the **From left**, **Right**, or **Center** alignment.
- In the *Right* box if you select **Left** alignment.

Specifying text flow

On the *Text Flow* tab of the Table Properties dialog (Figure 9), you can:

- Insert a page or column break either before or after the table. Use the **Text Flow: Break** option, combined with the **Page** or **Column** and the **Before** or **After** options. If you insert a page break before the table (that is, start the table on a new page), you can also change the page style that will go with it by selecting **With Page Style** and a new page style. As with any page break, you can also reset the page numbers using the *Page number* box.
- Keep a table on one page by deselecting **Allow table to split across pages and columns**. If this item is deselected, the next item is not active.
- Keep each row on one page by deselecting **Allow row to break across pages and columns**.
- Use **Keep with next paragraph** to keep the table and an immediately following paragraph together if you insert a page break.
- Use **Repeat heading**, and its associated numbers box, to select the number of table heading rows that will be repeated on each page. A complicated table may need two or three heading rows to be easily read and understood.
- Use the **Text orientation** list to select the direction for the text in the cells. Select from *Horizontal*, *Vertical (top to bottom)*, *Vertical (bottom to top)*, or *Use superordinate object settings* (meaning use the default text flow settings for the page).
- Select the vertical alignment of the text in the table or the selected cells; the choices are to align with the top of the cell, the center of the cell, or the bottom of the cell. This alignment is in addition to the Left-Right alignment options available on the *Table* tab of the Table Properties dialog.

✓ Note

A table heading row cannot span two pages, but any other row can. A one-row table (often used for page layout purposes), if set up with the default of including a heading, will not break across pages. The solution is to make sure the table is defined without a heading row.

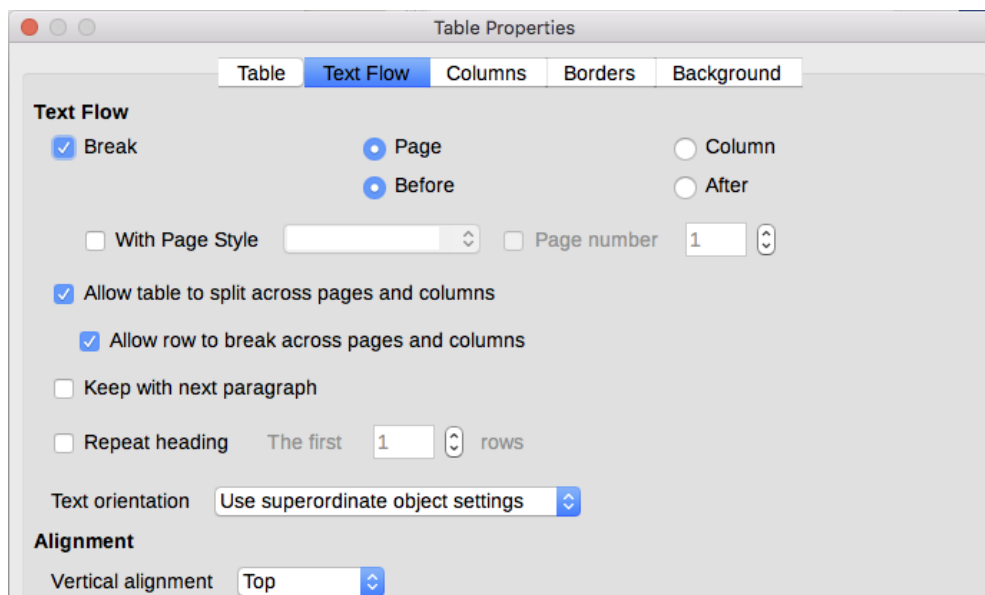

Figure 9: Table Properties dialog: Text Flow tab

Resizing rows and columns

You can adjust the height of rows and the width of columns in a table in several ways.

- Move the mouse next to the edge of the cell and when a double-headed arrow appears, click and hold the left mouse button, drag the border to the desired position, and release the mouse button.
- On the horizontal ruler, column dividers are marked by a pair of thin gray lines; the vertical ruler indicates row dividers in the same way. You can resize a row or column by holding the mouse button down on the appropriate divider and dragging it to the desired location.
- Use the keyboard as described below.

Selecting **Table > Size** on the Menu bar also offers some resizing options:

- Select *Column Width* or *Row Height* to enter a dimension into the size box for each selectable column or row of the table.
- The *Minimize Column Width* or *Minimize Row Height* options make the selected columns or rows as narrow as possible while still fitting their contents. The rows or columns may not all be the same height or width.
- The *Optimal Column Width* or *Optimal Row Height* options make the selected columns or rows fit the largest character in any row or the longest entry in any column.
- Use *Distribute Columns/Rows Evenly* to quickly bring them back to all being the same width or height.

For greater control over the width of each column, use the *Columns* tab of the Table Properties dialog.

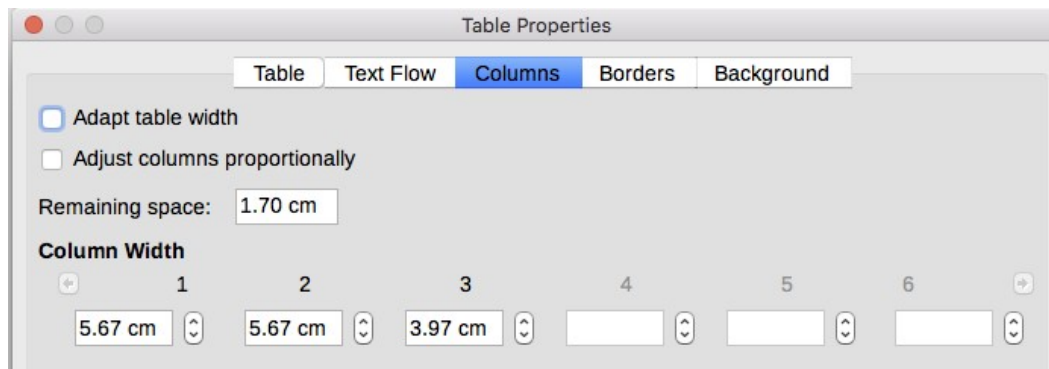

Figure 10: Table Properties dialog: Columns tab

Right-click on the table and choose **Table Properties** in the context menu, or choose **Table > Properties** on the Menu bar, or click the **More Options** icon in the Table panel of the Properties deck on the Sidebar. On the Table Properties dialog, select the *Columns* tab.

- **Adapt table width:** If a table already stretches to the page margins, it cannot stretch any wider and the *Adapt table width* option can only be used to reduce the column width. If the table is narrower, increasing the width of a column will increase the width of the whole table. This option is not available if *Automatic* has been selected in the *Alignment* area of the Table tab.
- If the table width already extends past the margins, with the *Adapt table width* option checked, attempting to change a column width will automatically decrease that column's size so that the table will now shrink to the page margins while keeping the size of any other column intact.
- **Adjust columns proportionally** results in all columns changing their widths by the same percentage when one is changed. For example, if you reduce by half the size of a column, the sizes of all the other columns will be halved. This option is not available if *Automatic* has been selected in the *Alignment* area of the Table tab.
- **Remaining space** shows how much further the table can expand before hitting the limit of the margins. This value cannot be edited and will not be negative in the event that the table width is already larger than the space between the left and right margins.
- Under **Column width**, each individual column can be adjusted. If you have more than six columns, use the arrows at the right and left to view them all. With no options selected, the column to the right of the one being adjusted will automatically change to keep the table width constant. Adjusting the most right hand column causes the first column to change.

Tip

Rather than starting from the Table Properties dialog, it is often more efficient to make rough adjustments to a new table using the mouse, and then fine-tune the layout using the *Columns* tab and the *Table* tab of the Table Properties dialog.

You can also resize a table using the keyboard. This is sometimes easier than using the mouse.

- 1) Place the cursor in the cell where you want to make changes.
- 2) Press and hold the *Alt* key while using the arrow keys.
 - The left and right arrow keys adjust the column width by moving the border on the right edge of the cell, but not past the margin.
 - The up and down arrows adjust the row height (when possible) by moving the border on the lower edge of the cell.

To adjust the resizing parameters and behavior for keyboard handling, choose **Tools > Options > LibreOffice Writer > Table** (Figure 11).

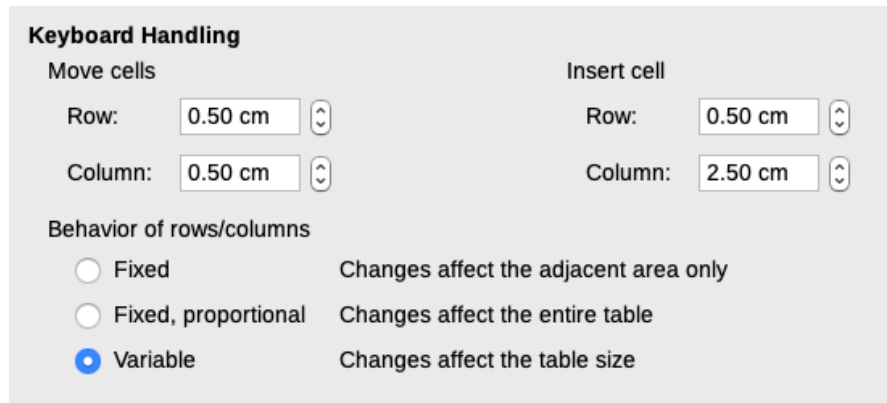

Figure 11: Choosing keyboard handling of table columns and rows

Use the *Row* and *Column* values in the *Move cells* section to determine the amount of change produced by a single keystroke while resizing. In the *Behavior of rows/columns* section, you can choose one of three strategies when resizing:

- **Fixed:** the resizing will affect only the adjacent cell and not the entire table. The width of the table does not change when resizing its cells.
- **Fixed, proportional:** when resizing a cell, all the other cells are also resized proportionally, but in the opposite direction so as to maintain the width of the table.
- **Variable:** resizing a cell affects the table size. For example, when you widen a cell, the width of the table increases. This is the default option.

Inserting rows and columns

To quickly insert one row or column, place the cursor in the row or column before or after which you want to add new rows or columns, and then do one of the following:

- Click the **Rows Above** or **Rows Below** icons on the Table toolbar or the Table panel of the Properties deck on the Sidebar to insert one row above or below the selected one.
- Click the **Columns Before** or **Columns After** icons on the Table toolbar or the Table panel of the Properties deck on the Sidebar to insert one column before or after the selected one.
- Choose **Table > Insert > Rows Above/Below** or **Table > Insert > Columns Before/After** on the Menu bar.
- Right-click and choose **Insert > Rows Above/Below** or **Insert > Columns Before/After** in the context menu.

To insert any number of rows or columns:

- 1) Place the cursor in the row or column where you want to add new rows or columns.
- 2) Choose **Table > Insert > Rows** or **Table > Insert > Columns** on the Menu bar, or right-click and choose **Insert > Rows** or **Insert > Columns** in the context menu.
- 3) In the small dialog that opens, select the number of rows or columns to add, and whether they appear before or after the one selected. Set **Number** to the number of rows or columns to insert, and **Position** to *Before* or *After*.
- 4) Click **OK** to close the dialog.

✓ Note

Regardless of how they are inserted, new rows or columns have the same formatting as the row or column where the cursor was located.

Deleting rows and columns

To quickly delete one or more rows or columns, select the rows or columns you want to delete and do one of the following:

- Click the **Delete selected rows** or **Delete selected columns** icons on the Table toolbar or the Table panel of the Properties deck on the Sidebar.
- Right-click and choose **Delete > Rows** or **Delete > Columns**.
- Choose **Table > Delete > Rows** or **Table > Delete > Columns** on the Menu bar.

Merging and splitting cells

A common use for merging cells is to make a heading row that takes up the entire width of the table, or a subheading row over more than one column.

To merge a cell or group of cells into one cell:

- 1) Select the cells to merge.
- 2) Right-click and choose **Merge Cells** in the context menu, or choose **Table > Merge Cells** from the Menu bar, or click the **Merge Cells** icon on the Table toolbar or the Table panel of the Properties deck on the Sidebar. Any content of the cells appears in the merged cell.

To split a cell into multiple cells:

- 1) Position the cursor inside the cell.
- 2) Right-click and choose **Split Cells** in the context menu, or choose **Table > Split Cells** on the Menu bar, or click the **Split Cells** icon on the Table toolbar or the Table panel of the Properties deck on the Sidebar.
- 3) On the Split Cells dialog, select how to split the cell and how many cells to create. A cell can be split either horizontally (create more rows) or vertically (create more columns).

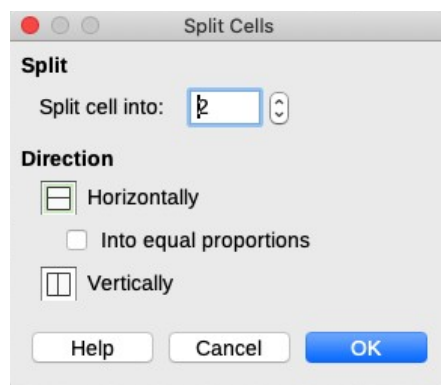

Figure 12: Split Cells dialog

It is generally best to merge and split cells after completing other layout formatting. This is because some operations such as deleting a column or a row may produce a result difficult to predict when applied to a table with merged or split cells.

Specifying table borders

You can quickly apply some table borders using the palette of options on the **Borders**, **Border Style**, and **Border color** icons in the Table toolbar or the Table panel of the Properties deck on the Sidebar. For more control, use the *Borders* tab of the Table Properties dialog (Figure 13).

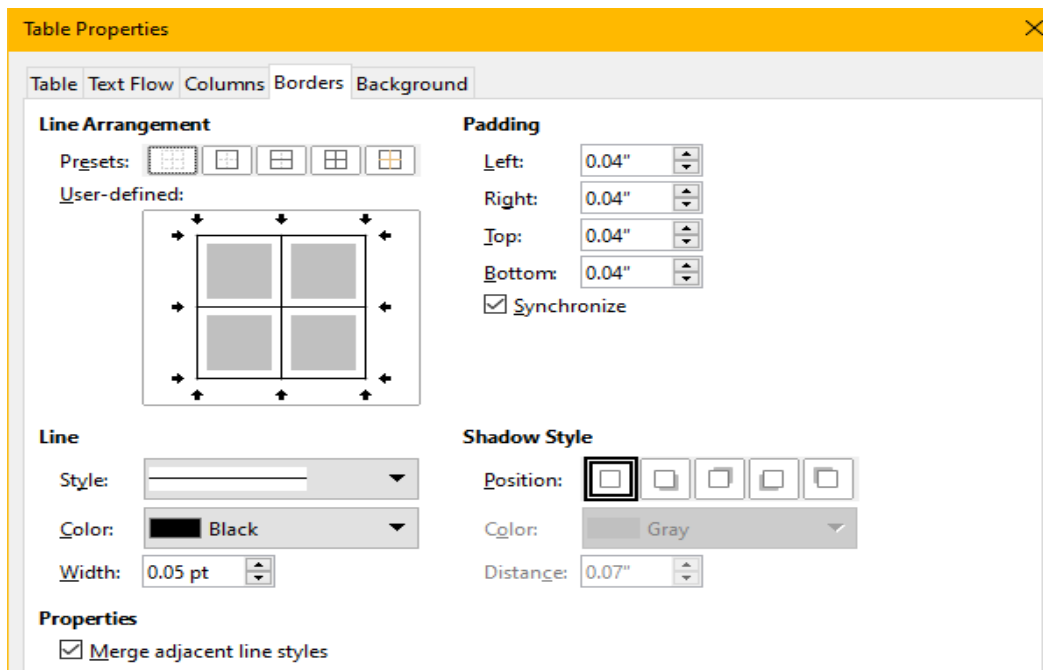

Figure 13: Table Properties dialog: Borders page

- **Line arrangement** specifies where the borders go. If a group of cells is selected, the border will be applied only to those cells. You can specify individually the style of the border for the outside edges of the selected cells and for the cell divisions. Writer provides default arrangements, but you can click the line you want to customize in the *User-defined* area to get exactly what you want. When multiple cells are selected, you can select the edges of the selection as well as the cell dividers.

✓ Note

When the selected cells have different styles of border, the *User-defined* area shows the border as a gray line. You can click the gray line to choose a new border style (first click), leave the border as it is (second click) or delete the border (third click).

- **Line** specifies what the border looks like. You can choose from the drop-down lists for Style and Color, and specify a Width. Your selections apply to those borders highlighted by a pair of black arrows in the *User-defined* area.
- **Padding** specifies how much space to leave between the border and the cell contents. Spacing can be specified individually for the left, right, top, and bottom borders. Choose **Synchronize** to have the same spacing on all four sides.
- **Shadow Style** properties always apply to the whole table. A shadow has three components: where it is (position), how far from the table it is cast (distance), and what color it is.
- If **Merge adjacent line styles** (under Properties) is checked, two cells sharing a common border will have their borders merged, rather than being side by side or above/below each other.

Tip

To reset everything if you are having problems with borders, right-click in the table and choose **Table Properties** or choose **Table > Properties** on the Menu bar. On the *Borders* tab, select the **Set No Borders** icon under *Line arrangement Presets* (the box on the left).

Selecting background colors and graphics

A table background can greatly improve the readability of data, visually highlight important parts of the table (such as the heading or a specific cell), or just make the table more appealing. You can choose between two types of background: solid color or image. The background can be applied to the whole table, to a single cell, or to a row.

You can quickly apply color cell backgrounds using the palette of options on the **Table Cell Background Color** icon in the Table toolbar or the Table panel of the Properties deck on the Sidebar. For more control, or to use an image as a background, use the *Background* tab of the Table Properties dialog (Figure 14).

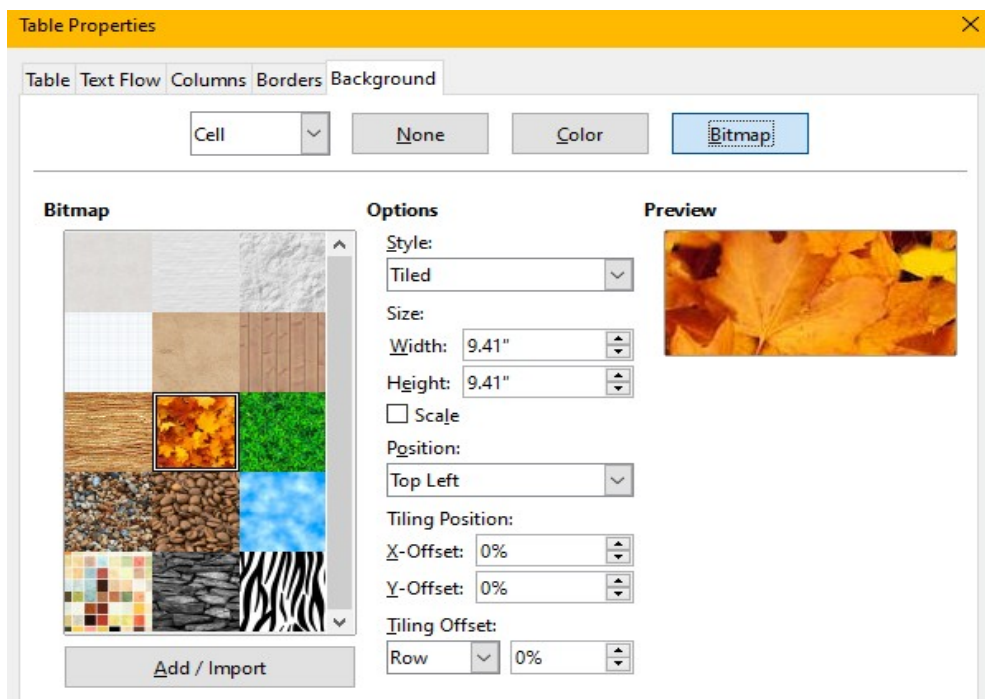

Figure 14: Table Properties dialog: inserting an image as a background

Tip

You need to consider the color contrast between the background and foreground (usually text). Background colors and images can also have transparency applied to help make the text more readable.

The row background option is quite handy when you want to create alternate color rows or assign a different background to the heading of the table.

Note

The background selected for a cell will be in front of the row background which in turn will be in front of (and hide) the table background.

To set the background for a cell, row, or table:

- 1) Place the cursor anywhere inside the cell, row, or table you want to work with. If you want to apply a background to a group of cells, select the group.
- 2) Right-click and choose **Table Properties** in the context menu, or choose **Table > Properties** on the Menu bar, or click the **More Options** icon on the Table panel of the Properties deck on the Sidebar.
- 3) In the Table Properties dialog, select the *Background* tab (Figure 14).
- 4) Choose whether to apply the settings to cell, row, or table.
 - **Cell**: changes apply only to the selected cells, or the cell where the cursor currently resides. Even when a group of cells is selected, the background settings are applied to each cell individually.
 - **Row**: changes affect the entire row where the cursor resides.
 - **Table**: changes will set the background for the entire table, regardless of the cursor position or selected cells.
- 5) To apply a color, click the **Color** button, select the color, and click **OK**.
To apply a bitmap (image), click the **Bitmap** button. Then,
 - a) Select from the given bitmaps or use the **Add/Import** button.
 - b) Under *Options*, select the type of placement for the image.
 - **Style** – select the way the image has to appear: custom position/size, tiled, or stretched.
 - **Size** – select the required Image aspect ratio or the Scale option.
 - **Position** – select where the image is to be displayed.
 - c) To apply the image, click **OK**.

Displaying or hiding table boundaries

A table boundary is a set of pale (usually gray) lines around the cells when viewed on-screen in LibreOffice with no borders enabled. These boundaries are not printed; their only function is to help you see where the table cells are. They are particularly useful when using tables for page layout.

To display tables the same way on the screen as on the printed page, with no boundary lines, go to **Tools > Options > LibreOffice > Application Colors**. On that page, you can display or hide boundaries around text, tables, headers and footers, figures, and other parts of a document, and you can choose the color of boundary lines.

Turning boundaries off does not hide any borders that the table may have.

Creating and applying table styles

Using table styles, you can apply an elaborate format to your table with just a few clicks. Like other styles, table styles enable you to produce consistent looking tables in a document.

Applying a table style

To apply a table style, go to the *Table Styles* tab of the Styles deck on the Sidebar. Then place the cursor anywhere in the table and double-click the name of a style.

For more control, go to **Table > AutoFormat Styles** on the Menu bar, or click the **AutoFormat Styles** icon on the Table toolbar. On the AutoFormat dialog (Figure 15), select a format from the

list, choose which features you wish to use in your table (font, alignment, borders, and so on), and then click **OK**. The table will be reformatted.

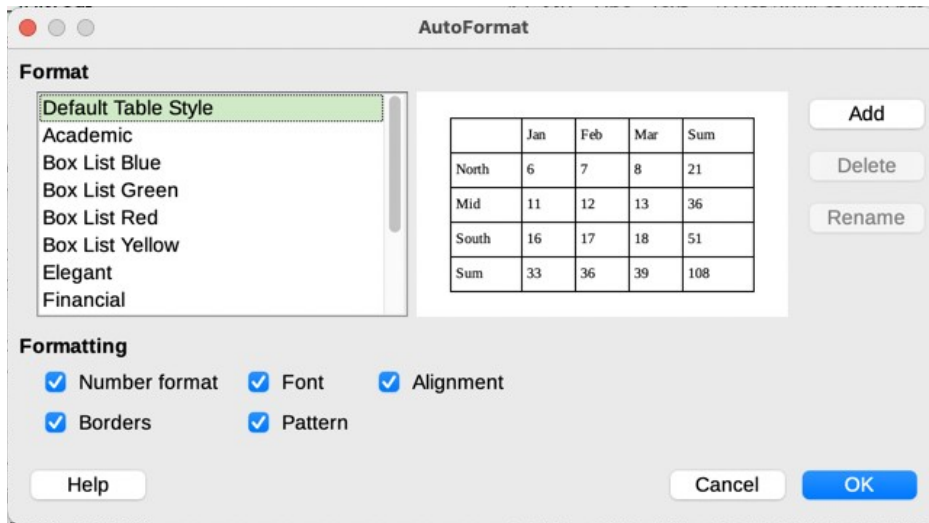

Figure 15: Table AutoFormat dialog

i Tip

You can rename the formats by selecting one and clicking the **Rename** button. The name will change in this dialog and in the Table Styles page on the sidebar.

You can delete a format by selecting it and clicking the **Delete** button. However, you cannot rename or delete the Default Table Style.

Creating a table style

Although the Table Styles tab of the Sidebar's Styles deck includes a quick way to apply table styles, they are created by using the AutoFormat feature. Follow these steps:

- 1) Create a table. Format it as you wish: font, alignment, borders, background, number format.
- 2) Put the cursor anywhere in the table. Select **Table > AutoFormat Styles** on the Menu bar, or click the **AutoFormat Styles** icon on the Table toolbar.
- 3) On the AutoFormat dialog (Figure 15), choose which features you wish to include in the new table style, and then click **Add**.
- 4) In the pop-up dialog, type a name for the new style and click **OK**. The new style is added to the list of formats in the AutoFormat dialog and to the list of table styles in the Styles deck in the sidebar.

Table styles also include the following table-level properties:

- Break
- Keep with next paragraph
- Repeat heading
- Allow table to split across pages
- Allow rows to break across pages
- Merge adjacent line styles
- Table shadow

Tip

These styles do not include table and column widths in the table format. To insert a table with predefined full formatting, save it as AutoText. See “Using AutoText” in Chapter 2, Working with Text: Basics, for instructions.

Formatting the table text

Once the table layout is set, you can move on to formatting the text in the individual cells. You can apply manual formatting as with any other paragraph in the text, but it is highly recommended that you use paragraph and character styles, for consistency and ease of maintenance. Other aspects to consider include text flow, alignment, and orientation.

You can format each cell independently of other cells, or you can simultaneously format a group of cells by selecting them before applying the desired formatting.

Tip

You can apply basic table text formatting by choosing a table style and then modify only those cells that you wish to be different.

Vertical alignment

By default, text entered into a table is aligned to the top-left of the cell. You can change the default for the entire table, as described above, or for individually selected cells.

To vertically align the text in specific cells:

- 1) Place the cursor in the cell you wish to change, or select multiple cells.
- 2) Click an icon on the Table toolbar: **Align Top**, **Center Vertically**, or **Align Bottom**.

Number formats

The number format can be set for a whole table, a group of cells, or a single cell. For example, cells can be set to display in a particular currency, to four decimal places, or in a particular date format.

Number recognition specifies that numbers in a text table are recognized and formatted as numbers. If Number recognition is not selected, numbers are saved in text format and are automatically left-aligned. To enable Number recognition, go to **Tools > Options > LibreOffice Writer > Table** and select the option in the *Input in Tables* section.

To set the number format for one or more cells, select the cells, then either click the icon for one of the popular formats on the Table toolbar, or choose **Table > Number Format** on the Menu bar. On the Format Number dialog (Figure 16), you can set options for various categories of numerical data.

- In the *Category* list, select the category you want, such as currency, date, or text.
- In the *Format* list, choose a format for the category you just selected.
- For some categories, such as *Date*, you may wish to change the language using the *Language* list, while for other numerical categories you can use the *Options* section of the dialog to customize the appearance.

Tip

Writer displays the formatting code for the category and format selected in *Format Code* section at the bottom of the dialog. For example, if you select a date format such as 31 Dec 1999 the corresponding code is D MMM YYYY. Advanced users can easily customize this formatting code as well as create new user-defined codes.

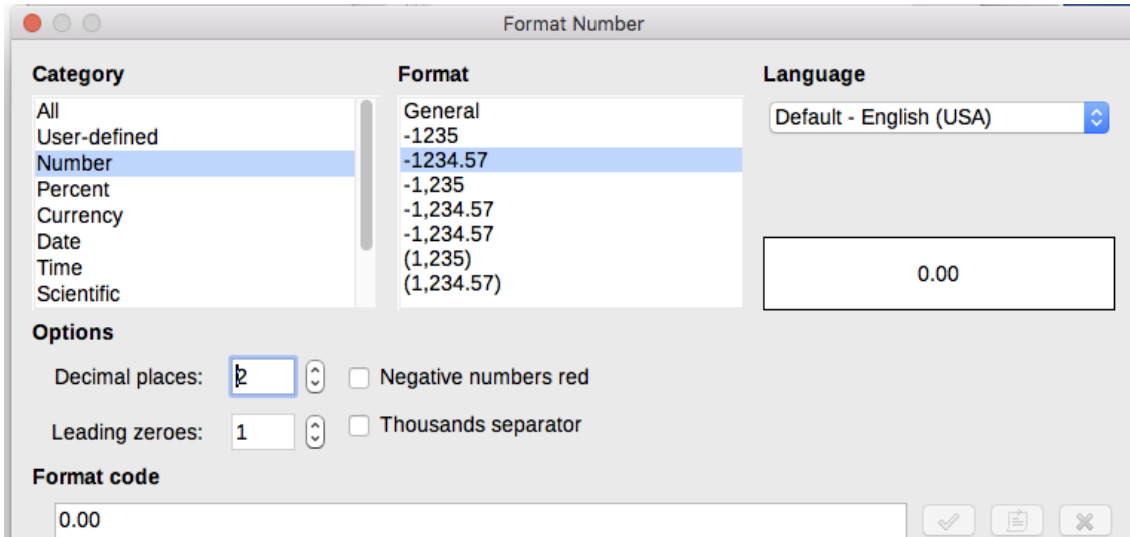

Figure 16: The Format Number dialog

Rotating text in a table cell

You can rotate text in a table cell by 90 or 270 degrees. Text rotation can be useful when you have long headings for narrow columns.

- Select the text to be rotated and then choose **Format > Character**, or right-click and select **Character > Character** in the context menu.
- On the *Position* tab, in the *Rotation / Scaling* section, choose the rotation angle, optionally change the Scale width, and click **OK**.

<i>This is long</i>	<i>Another long heading</i>	<i>A rotated heading</i>	<i>Another heading</i>	<i>Another heading</i>	<i>Another heading</i>	<i>Another heading</i>

Figure 17: A table with rotated headings

Note

Text rotation within table cells can also be achieved with the use of paragraph styles, discussed in detail in Chapter 9, Working with Styles.

Data entry and manipulation in tables

Moving between cells

Within a table, you can use the mouse, the arrow keys, or the *Tab* key to move between cells.

The arrow keys move the cursor one text character left or right at a time. If a cell is empty, pressing the arrow key will move the cursor to the adjacent cell.

The *Tab* key moves directly to the next cell and, if the cursor is in the last cell in the table, creates a new row. Pressing *Shift+Tab* moves the cursor back a cell.

Tip

To enter a *Tab* character as part of the text of the cell, press the *Ctrl* and *Tab* keys at the same time.

To move to the beginning of the table, press *Ctrl+Home*. If the active cell is empty, the move is to the beginning of the table. If the cell has content, the first press goes to the beginning of the cell and the next press goes to the beginning of the table. (Pressing again takes you to the beginning of the document.)

To move to the end of the table, press *Ctrl+End*. If the active cell is empty, the move is to the end of the table. If the cell has content, the first press goes to the end of the cell and the next press goes to the end of the table. (Pressing again takes you to the end of the document.)

Sorting data in a table

Just as in a spreadsheet, data in a table can be sorted. You can specify up to three levels of sorting (for example, sort first by age numerically, then alphabetically by name within each age).

To sort data in a table:

- 1) Select the table (or part of the table) to be sorted.
- 2) Choose **Table > Sort** on the Menu bar, or click the **Sort** icon on the Table toolbar.
- 3) In the Sort dialog (Figure 18):
 - a) Decide whether you want to sort in the direction of rows or columns. The default sorting direction is by rows, which results in sorting the data in a column.
 - b) Select up to three keys to sort on, in the correct order.
 - c) For each key, select which column or row to sort on, whether the sort is Numeric or Alphanumeric and whether it is Ascending or Descending.
 - d) Click **OK** to perform the sort.

Note

You have to select all cells that might be affected by the sorting. For example, if you select only the cells of one column, the sort affects that column only, while the others remain unchanged. In such a case, you risk mixing the data of the rows.

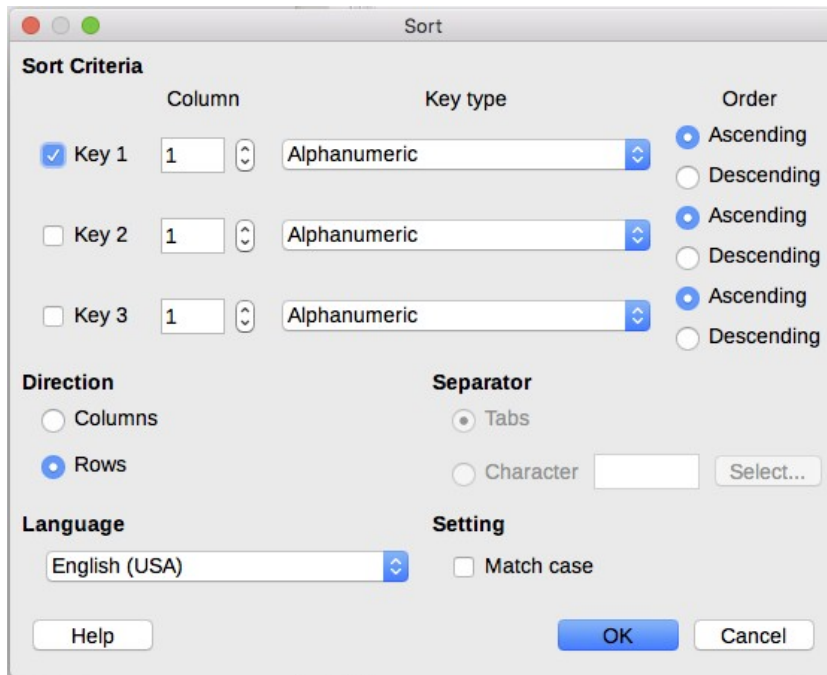

Figure 18: Selecting criteria for sorting

Using spreadsheet functions in a table

For many simple mathematical functions, Writer tables can be used as basic spreadsheets. Just as in a spreadsheet, each table cell is identified by a letter (for the column) and a number (for the row). For example, cell C4 is the cell in the third column from the left and fourth row from the top. When the cursor is in a cell, the table name and this cell reference is displayed on the status bar.

Tip

Basic spreadsheet functions in tables are much the same as in LibreOffice Calc. The main difference is that cell references are formatted differently. Cell A2 (first column, second row) is referred to in Calc as A2 (or \$A\$2 for an absolute reference). In Writer tables, it is referred to as <A2>.

For example, suppose you had two numbers in cells <B1> and <C2> and wanted to display the sum of the two in cell <A1>, as shown in Figure 19.

Do the following to sum up 4 and 5:

- 1) Click in cell <A1> and press the = key, or choose **Table > Formula** on the Menu bar, or press *F2*, or click the **Sum** icon or the **Formula** icon on the Table toolbar, or click the **Formula** icon in the Table panel of the Properties deck on the Sidebar.

The Formula bar appears automatically at the top of the workspace. In the leftmost side of the bar, you can see the coordinates of the selected cell.

- 2) Click in cell <B1>. The identifiers of this cell are automatically displayed in the Formula bar and inserted into cell <A1>.
- 3) Press the + key.
- 4) Click in cell <C2>. You can see the final formula = <B1>+<C2> displayed both in the selected cell and on the Object bar.
- 5) Press the *Enter* key, or click the green check mark (may be a different symbol on some installations) on the Formula Bar, to replace the formula in the cell with the result of the calculation.

Figure 19: Using spreadsheet functions in a table

Tip

To display a cell's formula and make it available for editing, choose **Table > Formula** on the Menu bar, or use one of the other methods above.

To display the list of the mathematical functions available for use in a table, display the Formula toolbar and then click the **Formula f(x)** icon.

In our example, this gives the result 9 in the top left cell. For summing contiguous cells, you can simply select the cells in the row, column, or the rectangle of rows and columns. Thus, for example, to add a column of numbers, do this:

- 1) Type an equals sign = in an empty cell.
- 2) Select the cells to be added together, in this case the cells from A2 to A5. The formula should be something like =<A2:A5>.
- 3) Press the *Enter* key or click the green check mark on the Formula Bar.
- 4) The result appears in the cell you have selected.

When using a function, you can type the cell references manually or select them. Thus, to add up the four numbers that we added above (A2, A3, A4, A5), do this:

- 1) Type an equals sign = in an empty cell.
- 2) Type sum or select it from the function list f(x).
- 3) Select the contiguous cells to be added together. The formula should be something like =sum<A2:A5>.
- 4) Press the *Enter* key or click the green check mark on the Formula Bar. The answer appears in the cell you have selected.

Caution

Unlike in Calc, formulas are not updated automatically when inserting or deleting rows or columns of the table, although the results do update when you change a value in a cell. If you plan to use complex formulas, consider embedding a Calc spreadsheet in the Writer document. See Chapter 19, Spreadsheets, Charts, Other Objects.

Additional table operations

Protecting cells in a table

You can protect the contents of individual cells of a table from changes. When a cell is protected, most of the menu items and toolbar icons are inactivated.

Note

This protection is not intended for secure protection. It protects the cells against accidental changes.

To turn on cell protection, place the cursor in a cell or select cells, then click the **Protect Cells** icon on the Table toolbar or choose **Table > Protect Cells** on the Menu bar.

To turn off cell protection, place the cursor in the cell or select the cells. Then click the **Unprotect Cells** icon on the Table toolbar or choose **Table > Unprotect Cells** on the Menu bar.

To remove protection for the entire current table or all selected tables, press *Shift+Ctrl+T*.

Tip

If you cannot place the cursor in a protected cell, you need to enable the cursor. Choose **Tools > Options > LibreOffice Writer > Formatting Aids** and in the *Protected Areas* section mark **Enable cursor**.

Adding a caption

You can easily add a caption to any table. Writer will keep track of all your captioned tables, automatically number them, and update any links to them. To add a caption to a table:

- 1) Right-click anywhere in the table and select **Insert Caption** in the context menu, or choose **Insert > Caption** on the Menu bar, or click the **Insert Caption** icon on the Table toolbar.
- 2) Under *Properties* on the Caption dialog, make your selections for the Category (it defaults to Table, which is usually what you want), Numbering, and Separator fields. The position of the caption defaults to above a table; you can change this if necessary.
- 3) Type your caption text in the text box at the top of the dialog.
- 4) Click **OK**.

You can also set up Writer to add captions to tables automatically. The procedure is the same as for adding captions automatically to images, described in Chapter 11.

Cross-referencing to a table

You can insert a cross-reference to a captioned table. Clicking on the cross-reference takes the reader directly to the table. For details, see Chapter 17, Fields.

Splitting a table

One table can be split into two tables, and two tables can be merged into a single table. Tables are split horizontally: the rows above the split point are put into one table, and the rows below into another.

To split a table:

- 1) Place the cursor in a cell that will be in the top row of the second table after the split (the table splits immediately above the cursor).

- 2) Choose **Table > Split Table** on the Menu bar or click the **Split Table** icon on the Table toolbar.
- 3) A Split Table dialog opens, where you can choose how to handle heading rows.
- 4) Click **OK**. The table is then split into two tables separated by a blank paragraph.

Note

If cells in one table include formulas using data from the other table, those cells will contain an error message: ****Expression is faulty****.

Merging tables

To merge two tables:

- 1) Delete the blank paragraph between the tables. You must use the *Delete* key (not the *Backspace* key) to do this.
- 2) Select any cell in one of the tables.
- 3) Choose **Table > Merge Table** from the Menu bar.

Tip

To see clearly where the paragraphs are and to delete them easily, choose **View > Formatting Marks** (*Ctrl+F10*) or click the ¶ icon in the Standard toolbar.

Deleting a table

To delete a table, do any of the following:

- Right-click anywhere in the table and choose **Delete > Table** in the context menu.
- Click anywhere in the table and choose **Table > Delete > Table** on the Menu bar.
- Select from the end of the paragraph before the table to the start of the paragraph after the table, and then press the *Delete* key or the *Backspace* key.

Note

The third method also merges the paragraph after the table with the paragraph before the table, which may not be what you want.

Copying a table

To copy a table from one part of the document and paste it into another part:

- 1) Select the table.
- 2) Press *Ctrl+C* or click the **Copy** icon on the Standard toolbar.
- 3) Click where you want the table to be copied.
- 4) Press *Ctrl+V* or click the **Paste** icon on the Standard toolbar.

Moving a table

To move a table from one part of a document to another part:

- 1) Select the table.
- 2) Press *Ctrl+X* or click the **Cut** icon on the Standard toolbar.
- 3) Click where you want the table to be moved.

- 4) Press *Ctrl+V* or click the **Paste** icon on the Standard toolbar. This pastes the cells and their contents and formatting.

Inserting a paragraph before or after a table

To insert a paragraph before a table, position the cursor *before* any text or other contents in the first (upper left-hand) cell and press *Alt+Enter*. To insert a paragraph after a table, position the cursor *after* any text in the last (lower right-hand) cell and press *Alt+Enter*.

Using tables as a page layout tool

Tables may be used as a page layout tool to position text in a document instead of using tabs or spaces. For more information and tips about using tables in page layout, see Chapter 6, *Formatting Pages: Advanced*.

Tip

When inserting a table used for layout, you may wish to deselect the **Heading** and **Border** options (see “Creating a new table” on page 7).
