Introduction to Calc error codes

Calc provides feedback for errors of miscalculation, incorrect use of functions, invalid cell references and values, and other user initiated mistakes. The feedback may be displayed within the cell that contains the error (Figure 1), or on the Status bar (Figure 2), or in both, depending on the type of error. Generally speaking, if the error occurs in the cell that is selected (or contains the cursor), the error message is displayed on the Status bar.

As an example, Figure 1 shows the error code returned when a column is too narrow to display the entire formatted date. The date displayed within the input line, 04/05/1998, would fit within the cell without a problem, but the format used by the cell produces the date value *Sunday, April 05, 1998*.

The screenshot shows a spreadsheet with columns A, B, C, and D, and rows 1, 2, and 3. The formula bar at the top shows the date 04/05/1998. Cell C2 contains the error code #####. Cell B2 contains the error code #REF!. Cell A2 contains the error code #NAME?. Row 3 is empty.

	A	B	C	D
1				
2	#NAME?	#REF!	#####	
3				

Figure 1: Error codes displayed within cells

When the cell displaying the **#REF!** error code in Figure 1 is selected, the Status bar displays the error message as shown in Figure 2. This message is more descriptive than the message displayed in the cell, but it still may not provide enough information to correctly diagnose the problem. For fuller explanations, consult the following tables and the Help topic, *Error Codes in LibreOffice Calc*.

Figure 2: An error message displayed in the Status bar

This appendix presents error codes in two tables.

- 1) Table 1 lists error strings which are displayed within the cell that actually contains the error. Except in the case of the **###** error, they all correspond to a Calc error code number. Alphanumeric codes such as *Err502* and *Err511* can also appear in cells; these are not separately identified in the Table 1 but their meanings are given in Table 2.
- 2) Table 2 explains all of the error codes, listed by code number, including those error codes in the first table.

Tip

You can use the `ERRORTYPE()` function to find the code number for an error occurring in a different cell. Refer to the Help system for more detail about this function.

Error codes displayed within cells

Table 1: Error codes in cells

Code	Message	Explanation of the error
N/A	###	The column is too narrow to display the complete formatted contents of the cell. This is not really an error value, so there is no corresponding numerical error code. The solutions to this problem are to increase the width of the column, or select Format > Cells > Alignment and click either <i>Wrap text automatically</i> or <i>Shrink to fit cell size</i> in the <i>Properties</i> area to make the text match the current column width.
503	#NUM!	A calculation resulted in an overflow of the defined value range.
519	#VALUE!	The formula within the cell returns a value that does not correspond to the definition of the formula or functions used. This error could also mean that the cell referenced by the formula contains text instead of a number.
524	#REF!	The formula within the cell uses a reference that does not exist. Either a column or row description name could not be resolved, or the column, row, or sheet that contains a referenced cell is missing.
525	#NAME?	An identifier could not be evaluated: no valid reference, no valid domain name, no column/row label, no macro, incorrect decimal divider, add-in not found. For example, entering in a cell <code>=sum(bob*5)</code> where there is no cell named "bob" or containing the text "bob" generates this error.
532	#DIV/0!	Division operator / if the denominator is 0. Some more functions return this error; see next table for details.

General error codes

The following table is an overview of the most common error messages for LibreOffice Calc.

Note

Errors described as *Internal errors* should not be encountered by users under normal conditions. Errors listed as *Not used* are not currently assigned to any error condition and will not occur.

Table 2: List of error codes

Code	Message	Explanation of the error
501	Invalid character	Character in a formula is not valid. This error is the same as the <i>Invalid Name</i> error (525) except that it occurs within a formula. The cell containing the error will display the #NAME? error reference.
502	Invalid argument	Function argument is not valid; for example, a negative number for the SQRT() function. This error also occurs if more than one matching cell is found by the DGET() function.

Code	Message	Explanation of the error
503	Invalid floating point operation (cell displays #NUM!)	Division by 0, or another calculation that results in an overflow of the defined value range (a value too big or too small).
504	Parameter list error	Function parameter is not valid; for example, text instead of a number, or a domain reference instead of a cell reference.
505	Internal syntax error	Not used.
506	Invalid semicolon	Not used.
507	Pair missing	Not used.
508	Pair missing	Missing bracket or parenthesis; for example, closing brackets but no opening brackets.
509	Missing operator	Operator is missing; for example, "=2 (3+4) * ", where the operator between "2" and "(" is missing.
510	Missing variable	Variable is missing; for example, when two operators are together "=1+*2".
511	Missing variable	Function requires more variables than are provided; for example, AND() and OR().
512	Formula overflow	The total number of internal tokens (that is, operators, variables, brackets) in the formula exceeds 8192, or the total number of matrices the formula creates exceeds 150. This includes basic functions that receive too large an array as a parameter.
513	String overflow	An identifier in the formula exceeds 64 KB in size, or a result of a string operation exceeds 64 KB in size.
514	Internal overflow	Sort operation attempted on too much numerical data (max. 100000) or a calculation stack overflow.
515	Internal syntax error	Not used.
516	Internal syntax error	Matrix is expected on the calculation stack, but is not available.
517	Internal syntax error	Unknown error; for example, a document with a newer function is loaded in an older version of Calc that does not contain the function.
518	Internal syntax error	Variable is not available.
519	No result (cell displays #VALUE!)	Formula yields a value that does not correspond to the definition, or a cell that is referenced in the formula contains text instead of a number.
520	Internal syntax error	Compiler creates an unknown compiler code.
521	Internal syntax error	No result.

Code	Message	Explanation of the error
522	Circular reference	Formula refers directly or indirectly to itself and the Iterations option is not selected under Tools > Options > LibreOffice Calc > Calculate .
523	The calculation procedure does not converge	Financial statistics function missed a targeted value, or iterations of circular references do not reach the minimum change within the maximum steps that are set.
524	Invalid references (cell displays #REF!)	A column or row description name could not be resolved, or the column, row, or sheet that contains a referenced cell is missing.
525	Invalid names (cell displays #NAME?)	An identifier could not be evaluated; for example, no valid reference, no valid domain name, no column/row label, no macro, incorrect decimal divider, add-in not found.
526	Internal syntax error	Obsolete, no longer used, but could come from old documents if the result is a formula from a domain.
527	Internal overflow	References, such as when a cell references a cell, are too encapsulated or deeply nested. This is an internal error and should not be displayed in LibreOffice.
528 to 531	—	Not used.
532	Division by zero (cell displays #DIV/0!)	Division operator / if the denominator is 0. Some more functions return this error; for example: VARP with less than 1 argument STDEVP with less than 1 argument VAR with less than 2 arguments STDEV with less than 2 arguments STANDARDIZE with stdev=0 NORMDIST with stdev=0
533	Nested arrays are not supported	For example, “ =<u>{1; {2}}</u>” ”
538	Error: Array or matrix size	—
539	Unsupported inline array content	For example, “ =<u>{1+2}</u>” ”
540	External content disabled	Occurs when a function that requires (re)loading of external sources is encountered and the user hasn't confirmed reloading of external sources yet.
