Sharon Whiston		

## Publication date and software version

Published 18 November 2011. Based on LibreOffice 3.4.3.

## Note for Mac users

---

Some keystrokes and menu items are different on a Mac from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this chapter. For a more detailed list, see the application Help.

<i>Windows or Linux</i>	<i>Mac equivalent</i>	<i>Effect</i>
<b>Tools &gt; Options</b> menu selection	<b>LibreOffice &gt; Preferences</b>	Access setup options
<i>Right-click</i>	<i>Control+click</i>	Opens a context menu
<i>Ctrl (Control)</i>	<i>⌘ (Command)</i>	Used with other keys
<i>F5</i>	<i>Shift+⌘+F5</i>	Opens the Navigator
<i>F11</i>	<i>⌘+T</i>	Opens the Styles and Formatting window

## Introduction

---

This chapter covers the basics of working with text in Writer, the word-processing component of LibreOffice. It assumes that you are familiar with the use of a mouse and keyboard and that you have read about Writer's menus and toolbars and other topics covered in Chapter 1, *Introducing Writer*.

We recommend that you also follow the suggestions in Chapter 2, *Setting up Writer*, about displaying formatting aids, such as end-of-paragraph marks, and selecting other setup options.

When you have read this chapter, you should know how to:

- Select, cut, copy, paste, and move text
- Find and replace text
- Insert special characters
- Format paragraphs and characters
- Create numbered or bulleted lists
- Check spelling, use the thesaurus, and choose hyphenation options
- Use the autocorrection, word completion, autotext, and line numbering features
- Track changes, undo and redo changes, and insert notes
- Link to other parts of a document

## Selecting text

---

Before you can do anything with text, you need to select it. Selecting text in Writer is similar to selecting anything in other applications.

In addition to selecting blocks of text, you can select items that are not consecutive, and columns (vertical blocks) of text.

### Selecting items that are not consecutive

To select nonconsecutive items (as shown in Figure 1) using the mouse:

- 1) Select the first piece of text.
- 2) Hold down the *Control* key and use the mouse to select the next piece of text.
- 3) Repeat as often as needed.

Now you can work with the selected text (copy it, delete it, change the style, and so on).

To select nonconsecutive items using the keyboard:

- 1) Select the first piece of text. (For more information about keyboard selection of text, see the topic "Navigating and Selecting with the Keyboard" in the LibreOffice Help (*F1*).)
- 2) Press *Shift+F8*. This puts Writer in "ADD" mode. The word ADD appears on the Status Bar.
- 3) Use the arrow keys to move to the start of the next piece of text to be selected. Hold down the *Shift* key and select the next piece of text.
- 4) Repeat as often as required.

Now you can work with the selected text.

Press *Esc* to exit from this mode.

## Around the World in 80 Days - Jules Verne

A puzzled grin overspread Passepartout's round face; clearly he had not comprehended his master.

"Monsieur is going to leave home?"

"Yes," returned Phileas Fogg. "We are going round the world."

Passepartout opened wide his eyes, raised his eyebrows, held up his hands, and seemed about to collapse, so overcome was he with stupefied astonishment.

"Round the world!" he murmured.

"In eighty days," responded Mr. Fogg. "So we haven't a moment to lose."

"But the trunks?" gasped Passepartout, unconsciously swaying his head from right to left.

"We'll have no trunks; only a carpet-bag, with two shirts and three pairs of stockings for me, and the same for you. We'll buy our clothes on the way. Bring down my mackintosh and traveling-cloak, and some stout shoes, though we shall do little walking. Make haste!"

Figure 1: Selecting items that are not next to each other

## Selecting a vertical block of text

You can select a vertical block or "column" of text that is separated by spaces or tabs (as you might see in text pasted from e-mails, program listings, or other sources), using LibreOffice's block selection mode. To change to block selection mode, use **Edit > Selection Mode > Block Area**, or press **Control+F8**, or click several times in the status bar on STD until it changes to BLK.

Now you can highlight the selection, using mouse or keyboard, as shown in Figure 2.

January	February	March
April	May	June
July	August	September
October	November	December

Figure 2: Selecting a vertical block of text

## Cutting, copying, and pasting text

Cutting and copying text in Writer is similar to cutting and copying text in other applications. You can copy or move text within a document, or between documents, by dragging or by using menu selections, icons, or keyboard shortcuts. You can also copy text from other sources such as Web pages and paste it into a Writer document.

To *move* (cut and paste) selected text using the mouse, drag it to the new location and release it. To *copy* selected text, hold down the **Control** key while dragging. The text retains the formatting it had before dragging.

When you paste text, the result depends on the source of the text and how you paste it. If you click on the **Paste** icon, then the pasted text keeps its original formatting (such as bold or italics). Text pasted from Web sites and other sources may also be placed into frames or tables. If you do not like the results, click the **Undo** icon or press **Control+Z**.

To make the pasted text take on the formatting of the text surrounding where it is pasted:

- Choose **Edit > Paste Special**, or
- Click the triangle to the right of the **Paste** icon, or
- Click the **Paste** icon without releasing the left mouse button.

Then select **Unformatted text** from the resulting menu.

The range of choices on the Paste Special menu varies depending on the origin and formatting of the text (or other object) to be pasted. See Figure 3 for an example with text on the clipboard.

*Figure 3: Paste Special menu*

## Finding and replacing text and formatting

---

Writer has two ways to find text within a document: the Find toolbar for fast searching and the Find & Replace dialog box. In the dialog box, you can:

- Find and replace words and phrases
- Use wildcards and regular expressions to fine-tune a search
- Find and replace specific formatting
- Find and replace paragraph styles

### Using the Find toolbar

If the Find toolbar is not visible, you can display it by choosing **View > Toolbars > Find** from the menu bar or by pressing *Control+F*. By default, the Find toolbar is located at the bottom of the LibreOffice window (just above the Status Bar) as shown in Figure 4, but you can float it or dock it in another location. For more information on floating and docking toolbars, see Chapter 1, *Introducing Writer*.

*Figure 4: Default position of Find toolbar*

To use the Find toolbar, click in the box and type your search text, then press *Enter* to find the next occurrence of that term. Click the **Find Next** or **Find Previous** buttons as needed.

### Using the Find & Replace dialog box

To display the Find & Replace dialog box, use the keyboard shortcut *Control+F* or choose **Edit > Find & Replace** from the menu bar. Optionally, click the **More Options** button to expand the dialog box; the button changes to **Fewer Options**.

To use the Find & Replace dialog box:

- 1) Type the text you want to find in the *Search for* box.
- 2) To replace the text with different text, type the new text in the *Replace with* box.
- 3) You can select various options, such as matching the case, matching whole words only, or doing a search for similar words. (See below for some other choices.)
- 4) When you have set up your search, click **Find**. To replace text, click **Replace** instead.

---

**Tip**

If you click **Find All**, Writer selects all instances of the search text in the document. Similarly, if you click **Replace All**, Writer replaces all matches.

---

**Caution**

Use **Replace All** with caution; otherwise, you may end up with some hilarious (and highly embarrassing) mistakes. A mistake with **Replace All** might require a manual, word-by-word, search to fix.

---

*Figure 5: Expanded Find & Replace dialog box*

## Find and replace specific formatting

A very powerful use of Find & Replace takes advantage of the **Format** option. For example, you might want to replace underlined words with italics.

On the Find & Replace dialog box (with **More Options** displayed, as in Figure 5):

- 1) To search for text with specific formatting, enter the text in the *Search for* box. To search for specific formatting only, delete any text in the *Search for* box.
- 2) Click **Format** to display the Text Format (Search) dialog box. The tabs on this dialog box are similar to those on the Paragraph format and Paragraph Style dialog boxes.
- 3) Choose the formats you want to search for and then click **OK**. The names of selected formats appear under the *Search for* box. For example, you might search for all text in 14-point bold Times New Roman.

- 4) To replace text as well as formatting, type the replacement text in the *Replace with* box. To search for specific text with specific formatting (for example, the word **hello** in bold), specify the formatting, type the text in the *Search for* box and leave the *Replace with* box blank. To remove specific character formatting, click **Format**, select the **Font** tab, then select the opposite format (for example, No Bold). The **No Format** button on the Find & Replace dialog box clears all previously selected formats.
- 5) Click **Find**, **Find All**, **Replace**, or **Replace All**.

### Tip

Unless you plan to search for other text using those same attributes, click **No Format** to remove the attributes after completing your search. If you forget to do this, you may wonder why your next search fails to find words you know are in the document.

## Finding and replacing paragraph styles

If you combine material from several sources, you may discover that lots of unwanted paragraph styles have suddenly shown up in your document. To quickly change all the paragraphs from one (unwanted) style to another (preferred) style:

- 1) On the expanded Find & Replace dialog box (Figure 5), select **Search for Styles**. (If you have attributes specified, this option is labeled **Including Styles**.) The *Search for* and *Replace with* boxes now contain a list of styles.
- 2) Select the styles you want to search for and replace.
- 3) Click **Find**, **Find All**, **Replace**, or **Replace All**.

Repeat steps 2 and 3 for each style that you want to replace.

## Using wildcards and regular expressions

Most users will be familiar with the concept of a *wildcard*—a special character that represents one or more unspecified characters. Wildcards make text searches more powerful but often less specific. LibreOffice enables you to use combinations of characters known as *regular expressions* which are more specific than simple wildcards but less so than a literal string. Regular expressions are very powerful but not very intuitive. They can save time and effort by combining multiple finds into one.

Table 1 shows a few of the regular expressions used by LibreOffice.

### Tip

The online help describes many more regular expressions and their uses.

To use wildcards and regular expressions when searching and replacing:

- 1) On the Find & Replace dialog box, click **More Options** to see more choices. On this expanded dialog box (Figure 5), select the **Regular expressions** option.
- 2) Type the search text, including the wildcards, in the *Search for* box and the replacement text (if any) in the *Replace with* box. Not all regular expressions work as replacement characters; the line break (`\n`) is one that does work.
- 3) Click **Find**, **Find All**, **Replace**, or **Replace All** (not recommended).

### Note

To search for a character that is defined as a wildcard, type a backslash (`\`) before the character to indicate that you are using it literally. For example, to find the text **\$5.00**, you would conduct a search using `\$5\ .00`.

Table 1. Examples of search wildcards (regular expressions)

To find	Use this expression	Examples and comments
Any single character	.	b.d finds <i>bad</i> , <i>bud</i> , <i>bid</i> , and <i>bed</i> .
One of the specified characters	[xyz]	b[iu]n finds <i>bin</i> and <i>bun</i> .
Any single character in this range	[x-y]	[r-t]eed finds <i>reed</i> , <i>seed</i> , and <i>teed</i> ; ranges must be in alphabetically ascending order.
Any single character except the characters inside the brackets	[^x]	p[^a]st finds <i>post</i> and <i>pest</i> , but not <i>past</i> .
The beginning of a word	\<start	\<log finds <i>logbook</i> and <i>logistics</i> , but not <i>catalog</i> .
The end of a word	end\>	log> finds <i>catalog</i> , but not <i>logistics</i> .
A paragraph marker	\$	Does not work as a replacement character. Use \n instead.
A line break	\n	Finds a line break that was inserted with <i>Shift+Enter</i> . When used as a replacement character, it inserts a paragraph marker.

## Inserting special characters

A *special character* is one not found on a standard English keyboard. For example, © ¼ æ ç Ł ñ ö ø ¢ are all special characters. To insert a special character:

- 1) Place the cursor in your document where you want the character to appear.
- 2) Click **Insert > Special Character** to open the Special Characters dialog box.
- 3) Select the characters (from any font or mixture of fonts) you wish to insert, in order; then click **OK**. The selected characters are shown in the lower left of the dialog box. As you select each character, it is shown on the lower right, along with the numerical code for that character.

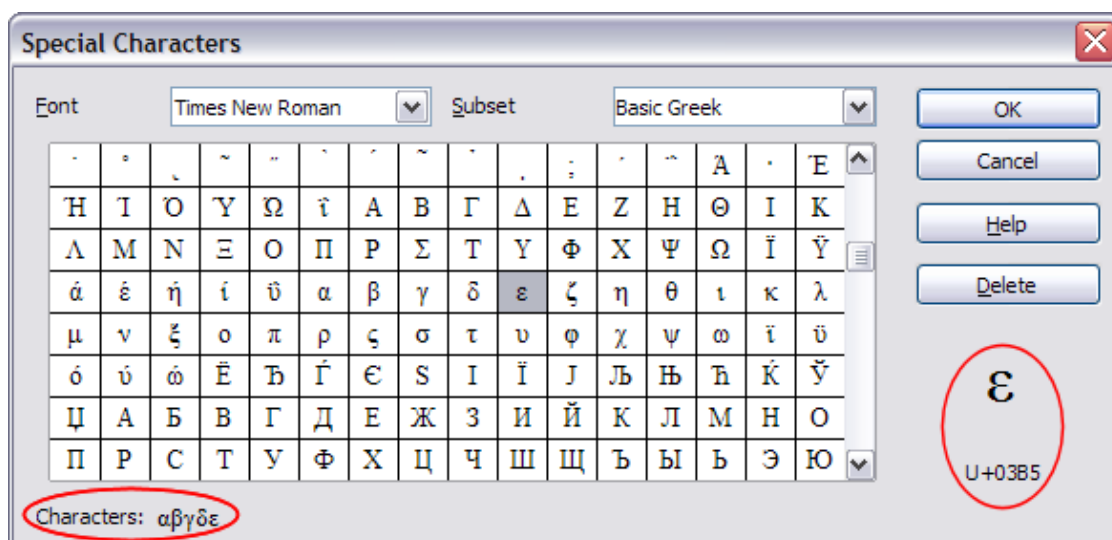

Figure 6: The Special Characters dialog box, where you can insert special characters

**Tip**

Different fonts include different special characters. If you do not find a particular special character you want, try changing the *Font* selection.

## Inserting non-breaking spaces and hyphens

### Non-breaking spaces

To prevent two words from being separated at the end of a line, press *Control+spacebar* after the first word.

### Non-breaking hyphen

You can use a non-breaking hyphen in cases where you do not want the hyphen to appear at the end of a line, for example in a number such as 123-4567. To insert a non-breaking hyphen, press *Shift+Control+minus sign*.

These are also available through **Insert > Formatting Mark**.

## Inserting en and em dashes

To enter en and em dashes, you can use the *Replace dashes* option under **Tools > AutoCorrect Options** (Figure 15 on page 16). This option replaces two hyphens, under certain conditions, with the corresponding dash.

In the following table, the A and B represent text consisting of letters A to z or digits 0 to 9.

<b>Text that you type:</b>	<b>Result</b>
A - B (A, space, hyphen, space, B)	A – B (A, space, en-dash, space, B)
A -- B (A, space, hyphen, hyphen, space, B)	A – B (A, space, en-dash, space, B)
A--B (A, hyphen, hyphen, B)	A—B (A, em-dash, B)
A-B (A, hyphen, B)	A-B (unchanged)
A -B (A, space, hyphen, B)	A -B (unchanged)
A --B (A, space, hyphen, hyphen, B)	A –B (A, space, en-dash, B)

Another means of inserting en or em dashes is through the **Insert > Special Characters** menu. Select the **U+2013** or **U+2014** character (found in the *General punctuation* subset), respectively.

A third method uses keyboard shortcuts. These shortcuts vary depending on your operating system.

**Tip**

You can also record macros to insert en and em dashes and assign those macros to unused key combinations, for example *Control+Shift+N* and *Control+Shift+M*. For more information, see Chapter 17, Customizing Writer.

### Windows

On most non-Asian installations of Windows, hold down one of the *Alt* keys and type on the numeric keypad: 0150 for an en dash or 0151 for an em dash. The dash appears when you release the *Alt* key.

### Tip

On a keyboard with no numeric keypad, use a *Fn* (*Function*) key combination to type the numbers. (The *Fn* key is usually to the right of the left-hand *Control* key on the keyboard.)

For example, on a US keyboard layout, the combination for an en dash should be *Alt+Fn+mjim* and for an em dash it should be *Alt+Fn+mjij*.

### Linux

Hold down the *Compose* key and type two hyphens and a period for an en dash, or three hyphens for an em dash. The dash appears when you release the *Compose* key.

### Tip

The key that operates as a *Compose* key varies with the Linux distribution. It is usually one of the *Alt* or *Win* keys, but may be another key, and should be user-selectable.

### Mac OS X

Hold down the *Option* (*Alt*) key and type a hyphen for an en dash. For an em dash, the combination is *Shift+Option+Hyphen*.

## Formatting paragraphs

You can apply many formats to paragraphs using the buttons on the Formatting toolbar. Figure 7 shows the Formatting toolbar as a floating toolbar, customized to show only the buttons for paragraph formatting. If you have Asian or Complex Text Layout language support enabled, two additional buttons are available: Left-to-Right and Right-to-Left. The appearance of the icons may vary with your operating system and the selection of icon size and style in **Tools > Options > LibreOffice > View**.

### Tip

The use of *paragraph styles* is highly recommended as an alternative to manually formatting paragraphs, especially for long or standardized documents. For information on styles and how to use them, see Chapters 6 and 7 in this book.

### Caution

Manual formatting (also called *direct formatting*) overrides styles, and you cannot get rid of the manual formatting by applying a style to it. To remove manual formatting, select the text, right-click, and choose **Clear Direct Formatting** from the pop-up menu.

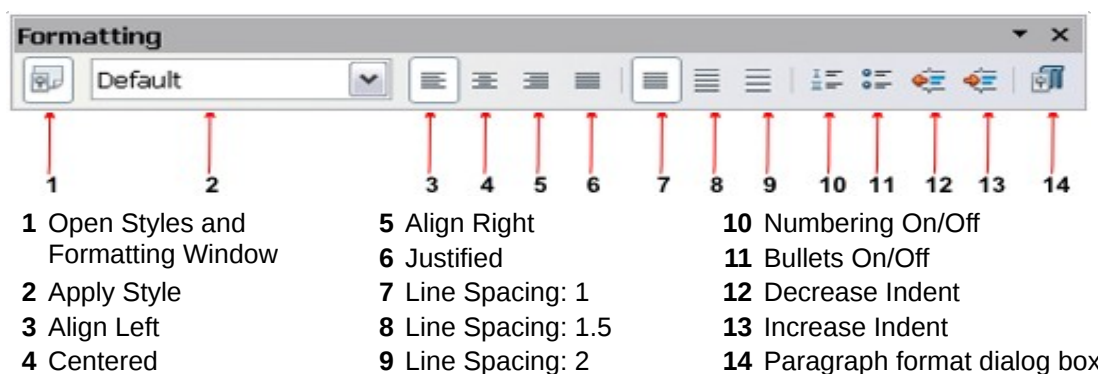

Figure 7: Formatting toolbar, showing icons for paragraph formatting

Figure 8 shows examples of the text alignment options.

Figure 8: Text alignment options

When using justified text, the last line is by default aligned to the left; however, if so desired, you can also align the last line to the center of the paragraph area or justify it so that spaces are inserted between the words in order to fill the whole line. If you select the **Expand single word** option, then whenever the last line of a justified paragraph consists of a single word, this word is stretched by inserting spaces between characters so that it occupies the full length of the line. Figure 9 shows an example of the effect obtained when setting each of these options.

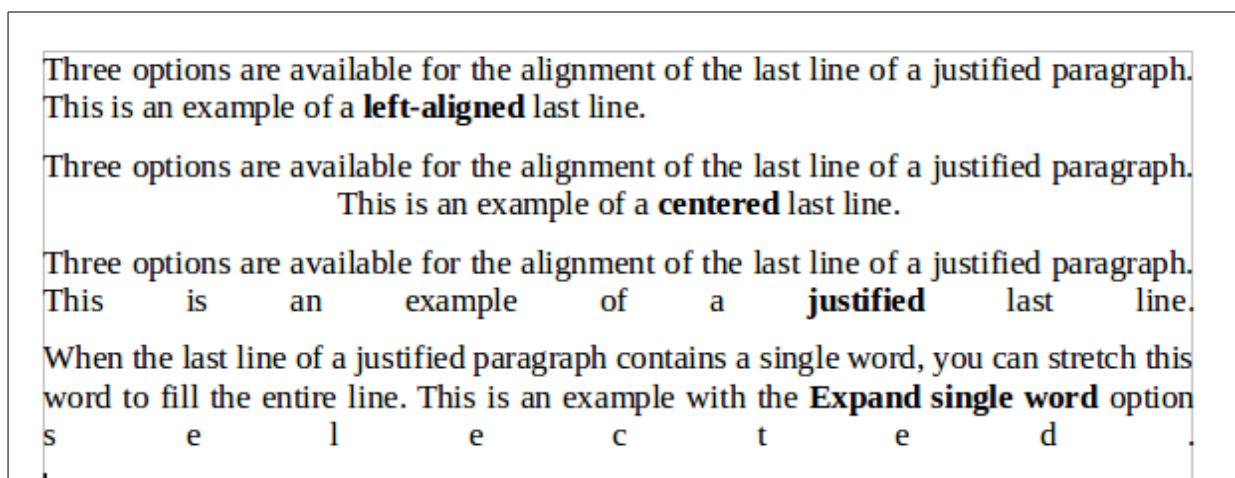

Figure 9: Four choices for the last line of a justified paragraph

These options are controlled in the *Alignment* page of the Paragraph dialog box, reached by choosing **Format > Paragraph** from the menu bar.

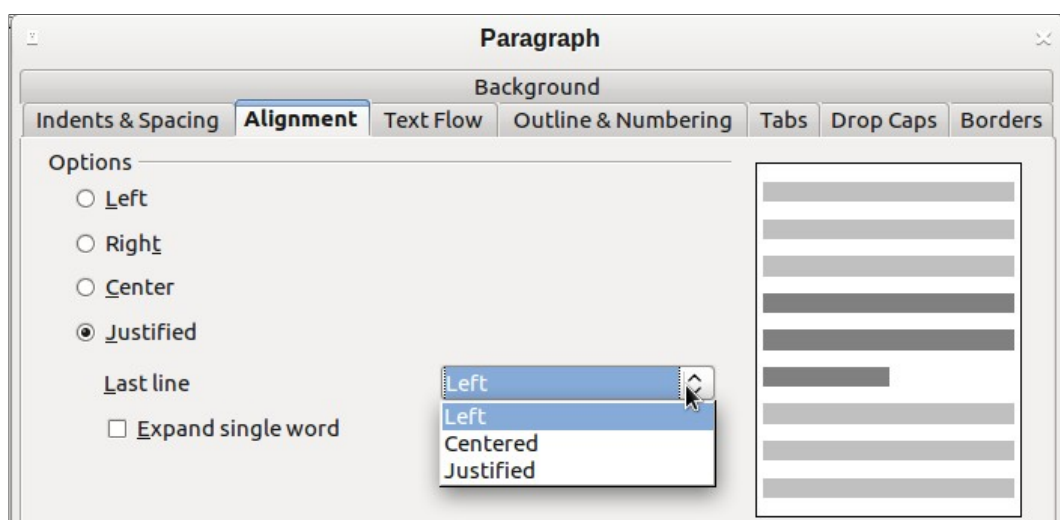

Figure 10: Options for the last line of a justified paragraph

## Setting tab stops and indents

The horizontal ruler shows both the default tab stops and any tab stops that you have defined. Tab settings affect indentation of full paragraphs (using the **Increase Indent** and **Decrease Indent** icons on the Formatting toolbar) as well as indentation of parts of a paragraph (by pressing the *Tab* key on the keyboard).

Using the default tab spacing can cause formatting problems if you share documents with other people. If you use the default tab spacing and then send the document to someone else who has chosen a different default tab spacing, tabbed material will change to use the other person's settings. Instead of using the defaults, define your own tab settings, as described in this section.

To define indents and tab settings for one or more selected paragraphs, double-click on a part of the ruler that is not between the left and right indent icons to open the *Indents & Spacing* page of the Paragraph dialog box. Double-click anywhere between the left and right indent icons on the ruler to open the *Tabs* page of the Paragraph dialog box.

A better strategy is to define tabs for the paragraph style. Refer to Chapters 6 and 7 for more about paragraph styles.

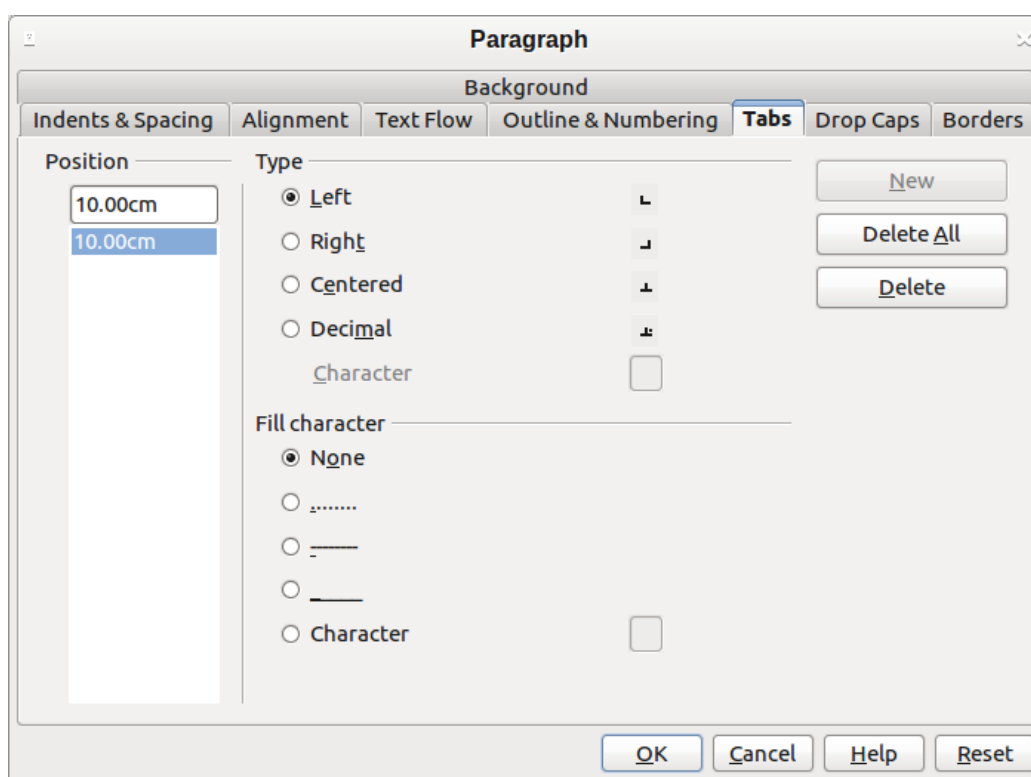

Figure 11: Specifying tab stops and fill characters

### Tip

Using tabs to space out material on a page is not recommended. Depending on what you are trying to accomplish, a table is usually a better choice.

## Changing the default tab stop interval

### Note

Any changes to the default tab setting will affect the existing default tab stops in any document you open afterward, as well as tab stops you insert after making the change.

To set the measurement unit and the spacing of default tab stop intervals, go to **Tools > Options > LibreOffice Writer > General**.

Figure 12: Selecting a default tab stop interval

You can also set or change the measurement unit for rulers in the current document by right-clicking on the ruler to open a list of units, as shown in Figure 13. Click on one of them to change the ruler to that unit. The selected setting applies only to that ruler.

Figure 13: Changing the measurement unit for a ruler

## Formatting characters

You can apply many formats to characters using the buttons on the Formatting toolbar. Figure 14 shows the Formatting toolbar customized to show only the buttons for character formatting. The appearance of the icons may vary with your operating system and the selection of icon size and style in **Tools > Options > LibreOffice > View**.

It is highly recommended that you use character styles rather than manually formatting characters. For information on styles and how to use them, see Chapters 6 and 7.

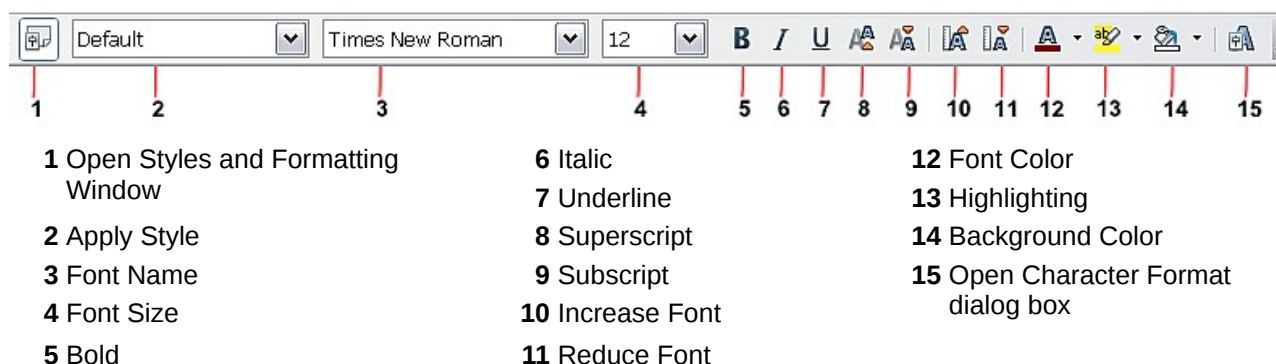

Figure 14: Formatting toolbar, showing icons for character formatting

### Tip

To remove manual formatting, select the text and choose **Format > Default Formatting** from the menu bar, or right-click and choose **Default Formatting** from the pop-up menu.

## Autoformatting

You can set Writer to automatically format parts of a document according to the choices made on the *Options* page of the AutoCorrect dialog box (**Tools > AutoCorrect Options**).

The Help describes each of these choices and how to activate the autoformats. Some common unwanted or unexpected formatting changes include:

- Horizontal lines. If you type three or more hyphens ( - - - ), underscores ( \_ \_ \_ ) or equal signs ( === ) on a line and then press *Enter* the paragraph is replaced by a horizontal line as wide as the page. The line is actually the lower border of the preceding paragraph.
- Bulleted and numbered lists. A bulleted list is created when you type a hyphen ( - ), asterisk ( \* ), or plus sign ( + ), followed by a space or tab at the beginning of a paragraph. A numbered list is created when you type a number followed by a period ( . ), followed by a space or tab at the beginning of a paragraph. Automatic numbering is only applied to paragraphs formatted with the *Default*, *Text body* or *Text body indent* paragraph styles.

### Tip

If you notice unexpected formatting changes occurring in your document, this is the first place to look for the cause.

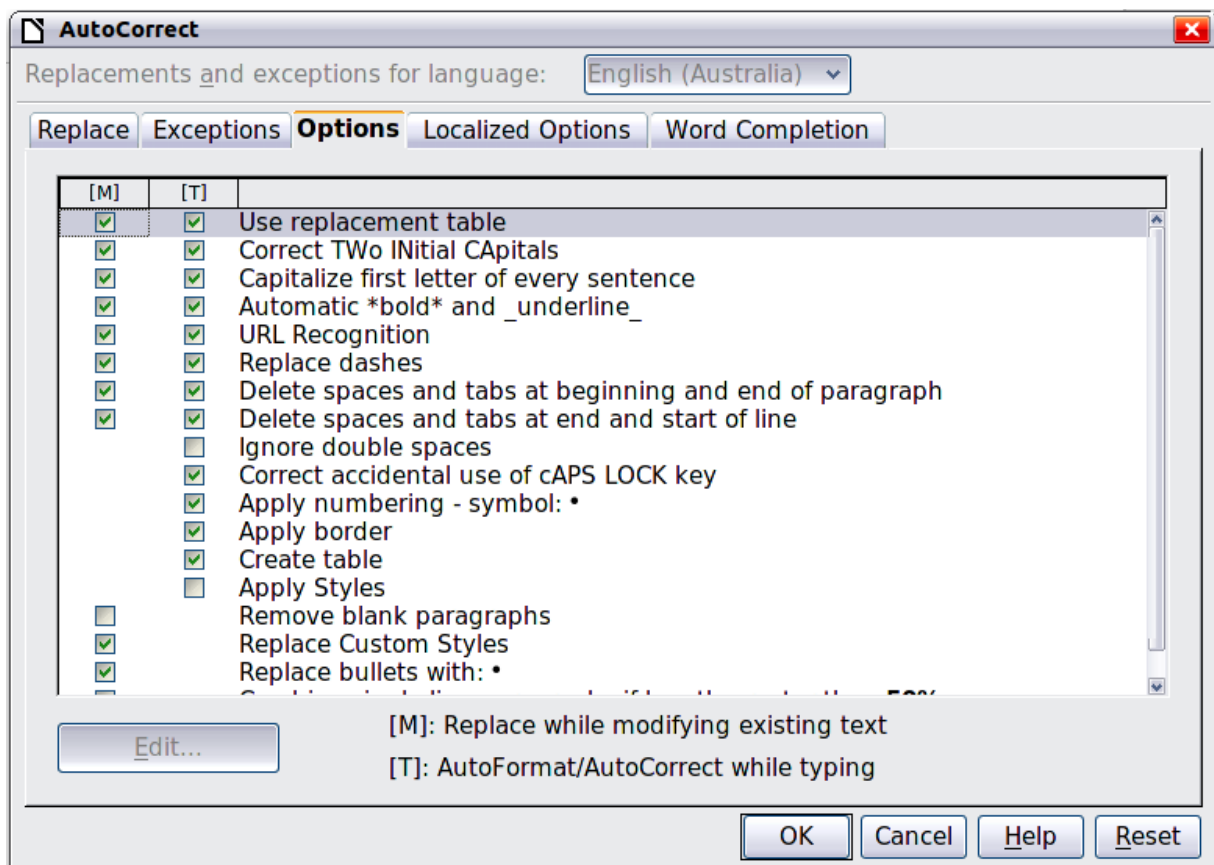

Figure 15: Autoformat choices on the Options page of the AutoCorrect dialog box

To automatically format the file according to the options you have set, choose **Format > AutoCorrect** and select or deselect the items on the submenu.

### While Typing

Automatically formats the document while you type.

## Apply

Automatically formats the document.

## Apply and Edit Changes

Automatically formats the file and then opens a dialog box where you can accept or reject the changes.

## AutoCorrect Options

Opens the AutoCorrect dialog box (Figure 15).

## Creating numbered or bulleted lists

There are several ways to create numbered or bulleted lists:

- Use autoformatting, as described above.
- Use list (numbering) styles, as described in Chapters 6 and 7 in this book.
- Use the **Numbering** and **Bullets** icons on the paragraph formatting toolbar (see Figure 7). This method is described here.

To produce a numbered or bulleted list, select the paragraphs in the list and then click on the appropriate icon on the toolbar.

### Note

It is a matter of personal preference whether you type your information first, then apply Numbering/Bullets or apply these as you type.

## Using the Bullets and Numbering toolbar

You can create a nested list (where one or more list items has a sub-list under it, as in an outline) by using the buttons on the Bullets and Numbering toolbar (Figure 16). You can move items up or down the list, or create subpoints, and even change the style of bullets. Use **View > Toolbars > Bullets and Numbering** to see the toolbar.

### Tip

It is possible to move a list entry up, together with all of its sub-entries. Do this by clicking the **Promote One Level With Subpoints** button.

- |                     |                                    |                             |
|---------------------|------------------------------------|-----------------------------|
| 1 Bullets On/Off    | 6 Promote One Level with Subpoints | 11 Move Up with Subpoints   |
| 2 Numbering On/Off  | 7 Demote One Level with Subpoints  | 12 Move Down with Subpoints |
| 3 Numbering Off     | 8 Insert Unnumbered Entry          | 13 Restart Numbering        |
| 4 Promote One Level | 9 Move Up                          | 14 Bullets and Numbering    |
| 5 Demote One Level  | 10 Move Down                       |                             |

Figure 16: Bullets and Numbering toolbar

If you create a nested list using the buttons on this toolbar, all the levels of the list (up to 10) apply the same numbering (or bullet). However, in many circumstances you will want to use a combination of numbering formats and bullets when creating nested lists. Such lists, with a mixture of numbering formats and bullets, can be easily configured as described in the following example. Additional information on lists, in particular the technique to create your own list style, is described in Chapter 7, Working with Styles.

## Tip

When creating nested lists, one option is to enter all the list paragraphs first and apply the levels afterwards.

You can use keyboard shortcuts to move paragraphs up or down the outline levels. Place the cursor at the beginning of the numbered paragraph and press:

*Tab* Down a level

*Shift+Tab* Up a level

To insert a tab stop at the beginning of a numbered paragraph (that is, after the number but before the text), press *Control+Tab*.

## Example: configuring a nested list

We will use a numbering style to produce the following effect:

- I. Level-1 list item
  - A. Level-2 list item
    - i. Level-3 list item
      - a) Level-4 list item

This example uses one of the supplied styles, *Numbering 1*. If you intend to reuse this type of nested list, you can also create a new style as illustrated in Chapter 7, Working with Styles.

- 1) Open the Styles and Formatting window and click the *List Styles* icon at the top. Specify *All* in the drop-down list at the bottom of the window. Right-click on the *Numbering 1* style and choose **Modify** from the pop-up menu.

Figure 17: Modifying a list style

- 2) On the Numbering Style dialog box, go to the *Outline* page, where you will find that one style matches our requirements. Click once on that style.

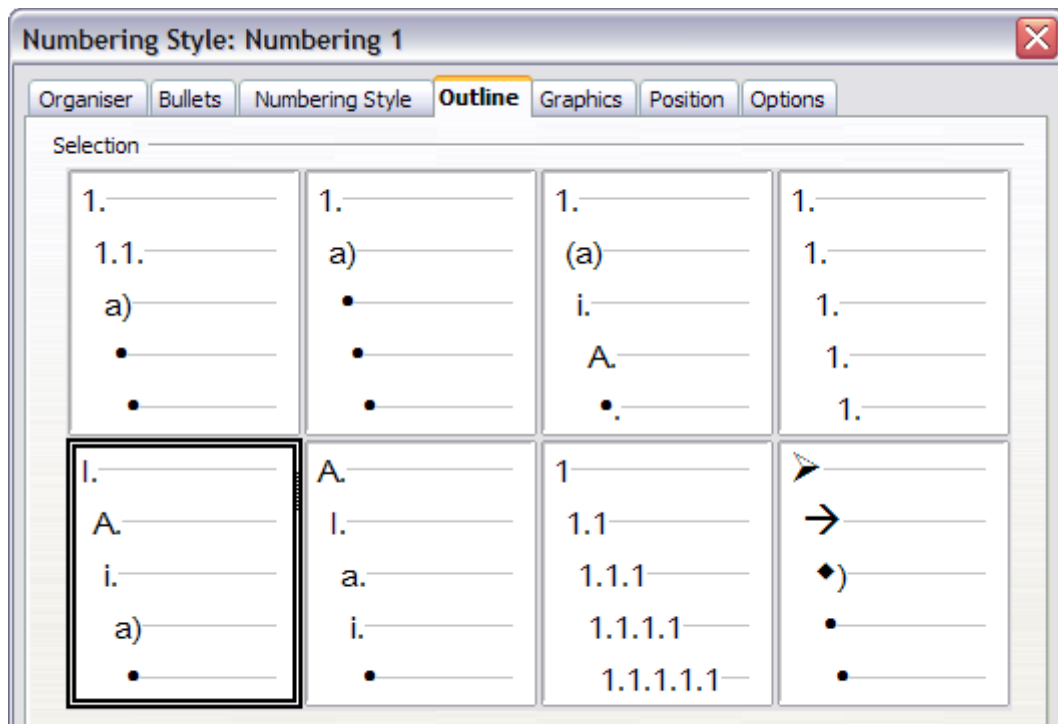

Figure 18: Choosing a predefined outline-numbering style

- 3) To modify the layout of the list, use the *Options* tab (Figures 19 and 20). Notice that the preview on the right shows the outline selected. In the *Level* box on the left, select **1**, then **2**, **3**, and **4** and see how the information in the *Numbering* and *After* boxes changes. Use the *Options* page to set different punctuation; for example, a period (full stop) after “a” on level 4 instead of a parenthesis.

Figure 19: Checking the outline numbering for level-1 list items

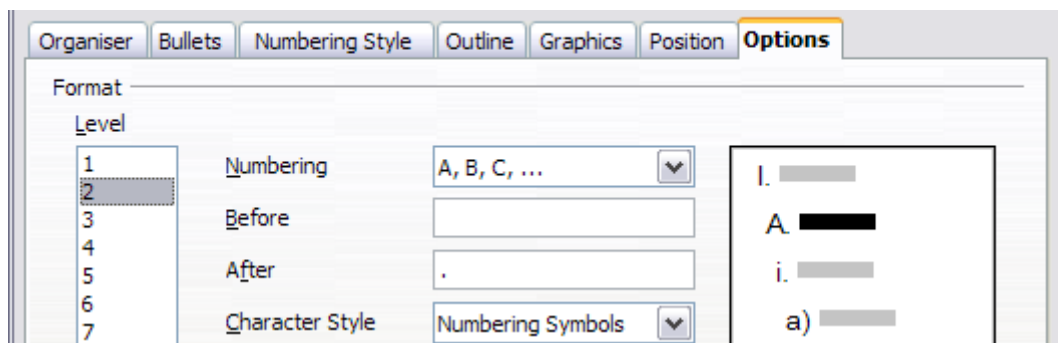

Figure 20: Numbering style for level-2 list items

To make the indentation at each level greater or less than the default, change it on the *Position* page. Select the level, then make any changes in the indentation, spacing, or numbering alignment.

- 4) Repeat for each level as required, then click **OK**.

### Tip

With outline numbering you can define different bullet styles for the different levels of a bullet list. Use the *Bullets* tab of the Bullets and Numbering dialog box (not shown) to select the basic style. Return to the *Options* tab to customize the bullet for each indent level. Here you can set bullets to any character. See the *Graphics* tab for more bullets.

## Using footnotes and endnotes

Footnotes appear at the bottom of the page on which they are referenced. Endnotes are collected at the end of a document.

To work effectively with footnotes and endnotes, you need to:

- Insert footnotes.
- Define the format of footnotes.
- Define the location of footnotes on the page, and the color and line styles for separator lines.

### Inserting footnotes/endnotes

To insert a footnote or an endnote, put the cursor where you want the footnote/endnote marker to appear. Then select **Insert > Footnote/Endnote** from the menu bar or click the **Insert Footnote/Endnote Directly** or **Insert Endnote Directly** icon on the Insert toolbar.

Figure 21: Using the Insert Footnote Directly icon on the toolbar

A footnote or endnote marker is inserted in the text and, depending on your choice, the cursor is relocated either to the footnote area at the bottom of the page or to the endnote area at the end of the document. Type the footnote or endnote content in this area.

If you use **Insert > Footnote/Endnote**, the Insert Footnote/Endnote dialog box (Figure 22) is displayed. Here you can choose whether to use the automatic numbering sequence specified in the footnote settings and whether to insert the item as a footnote or an endnote.

If you use the **Insert Footnote/Endnote Directly** or **Insert Endnote Directly** icon, the footnote or endnote automatically takes on the attributes previously defined in the Footnote Settings dialog box.

You can edit an existing footnote or endnote the same way you edit any other text.

To delete a footnote or endnote, delete the footnote marker. The contents of the footnote or endnote are deleted automatically, and the numbering of other footnotes or endnotes is adjusted automatically.

Figure 22: Inserting a footnote/endnote

## Defining the format of footnotes/endnotes

To format the footnotes themselves, click **Tools > Footnotes/Endnotes**. On the Footnotes/Endnotes Settings dialog box, choose settings as required.

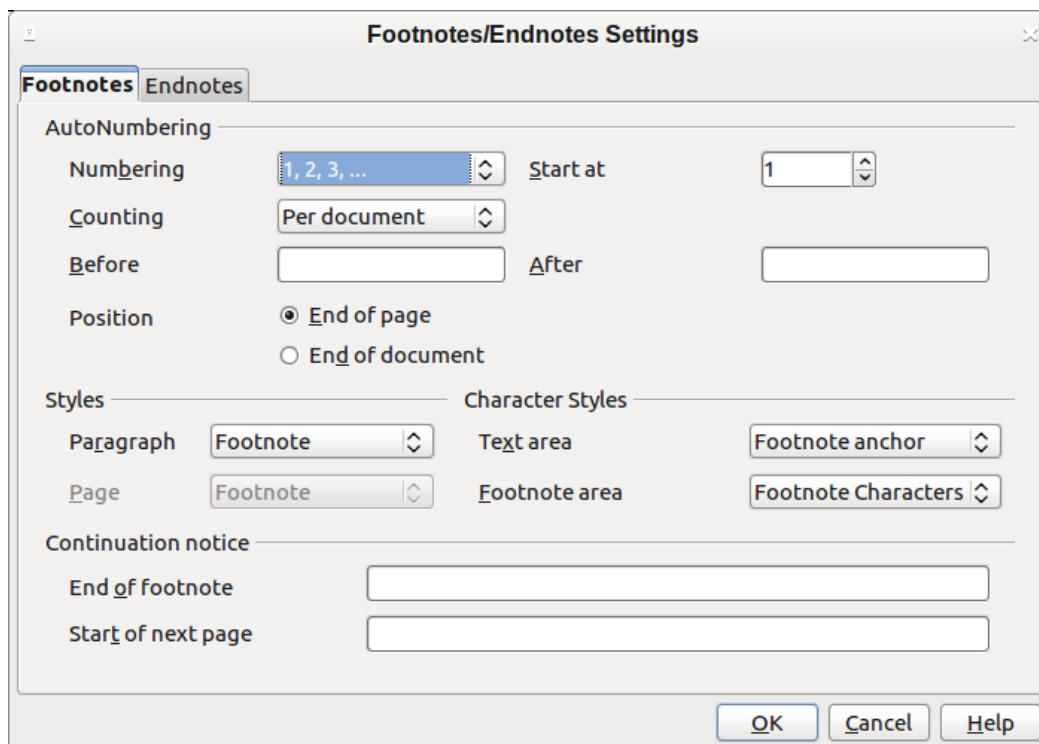

Figure 23: Defining footnote formatting

## Defining footnote location and separator line

The location of footnotes on the page, and the color and style of the line that separates the footnotes from the text, are defined in the page style. If you are using several page styles, and may have footnotes on any of them, you need to define the footnote location and separator line on each of the page styles.

Choose **Format > Page** from the menu bar or right-click on a page and choose **Page...** from the pop-up menu, to display the Page Style dialog box. Go to the Footnote tab (Figure 24) and make your selections, then click **OK** to save the changes.

Figure 24: Defining footnote location and separator line

## Checking spelling

Writer provides a spelling checker, which can be used in two ways.

**AutoSpellcheck** checks each word as it is typed and displays a wavy red line under any misspelled words. When the word is corrected, the red wavy line disappears.

To perform a separate spelling check on the document (or a text selection) click the **Spelling and Grammar** button. This checks the document or selection and opens the Spelling dialog box (Figure 25) if any misspelled words are found.

Here are some more features of the spelling checker:

- You can right-click on a word with a wavy underline, to open a powerful context menu. If you select from the suggested words on the menu, the selection will replace the misspelled word in your text. Other menu options are discussed below.
- You can change the dictionary language (for example, Spanish, French, or German) on the Spelling and Grammar dialog box.
- You can add a word to a dictionary. Click **Add** in the Spelling and Grammar dialog box and pick the dictionary to add it to.
- Click the **Options** button on the Spelling dialog box to open a dialog box similar to the one in **Tools > Options > Language Settings > Writing Aids** described in Chapter 2. There you can choose whether to check uppercase words and words with numbers. You can also add or delete dictionaries and add or delete words in a dictionary.
- On the *Font* tab of the Paragraph Styles dialog, you can set paragraphs to be checked in a specific language (different from the rest of the document). See Chapter 7, Working with Styles, for more information.

Figure 25: Selecting a word from dictionary using the Spelling dialog box

Writer does not include a grammar checker, but you can install an extension such as Language Tool (from <http://www.language-tool.org/>) and access it from **Tools > Spelling and Grammar**. (See Chapter 17 for more about installing extensions.)

Language Tool adds a new menu item and submenu to the Tools menu, from which you can configure the tool and check or recheck the document.

## Using built-in language tools

Writer provides some tools that make your work easier if you mix multiple languages within the same document or if you write documents in various languages:

- Paragraph and character styles
- Using **Tools > Language**
- Using language settings in Options
- Using the status bar

The main advantage of changing the language for a text selection is that you can then use the correct dictionaries to check spelling and apply the localized versions of AutoCorrect replacement tables, thesaurus, and hyphenation rules.

You can also set the language for a paragraph or a group of characters as **None (Do not check spelling)**. This option is especially useful when you insert text such as web addresses or programming language snippets that you do not want to check for spelling.

## Using paragraph and character styles

Specifying the language in character and paragraph styles is the preferred method, because styles allow a greater level of control and make changing the language much faster. On the *Font* tab of the Paragraph Style dialog box, you can specify that certain paragraphs be checked in a language that is different from the language of the rest of the document. See Chapter 7, Working with Styles, for information on how to manage the language settings of a style.

## Using Tools > Language

You can also set the language for the whole document, for individual paragraphs, or even for individual words and characters, from **Tools > Language** on the menu bar.

### For Selection

Applies a specified language to the selected text.

### For Paragraph

Applies the specified language to the paragraph where the cursor is located.

### For all Text

Applies the specified language to all of the document, including text inserted after making the change.

## Using language settings in Options

Another way to change the language of a whole document is to use **Tools > Options > Language Settings > Languages**. In the *Default languages for documents* section (Figure 26), you can choose a different language for all the text that is not explicitly marked as a different language.

Figure 26: Options available in the Languages settings

### Caution

Unlike the menu tool that applies to the individual document, a change in the default language from the Options dialog box is a general change of settings of LibreOffice and will therefore apply to all the documents created in the future. If you want to change the language for the current document only, be sure to select the *For the current document only* option.

The spelling checker works only for those languages in the list which have the symbol  next to them. If you do not see this symbol next to your preferred language, you can install the dictionary using **Tools > Languages > More dictionaries online**.

## Using the status bar

The language used for checking spelling is also shown in the status bar, next to the page style in use. You can change the language for the paragraph or the entire document; click on the language in the status bar to pop up a menu of choices.

Figure 27: Language choices on the status bar

Notice the *Reset to Default Language* option on the menu and submenu. This is the fastest way to return a paragraph or the entire document to the default language set in **Tool > Options** (described above).

## Using synonyms and the thesaurus

You can access a short list of synonyms from the context menu:

- 1) Select a word or phrase, right-click, and point to **Synonyms** on the pop-up menu. A submenu of alternative words and phrases is displayed.

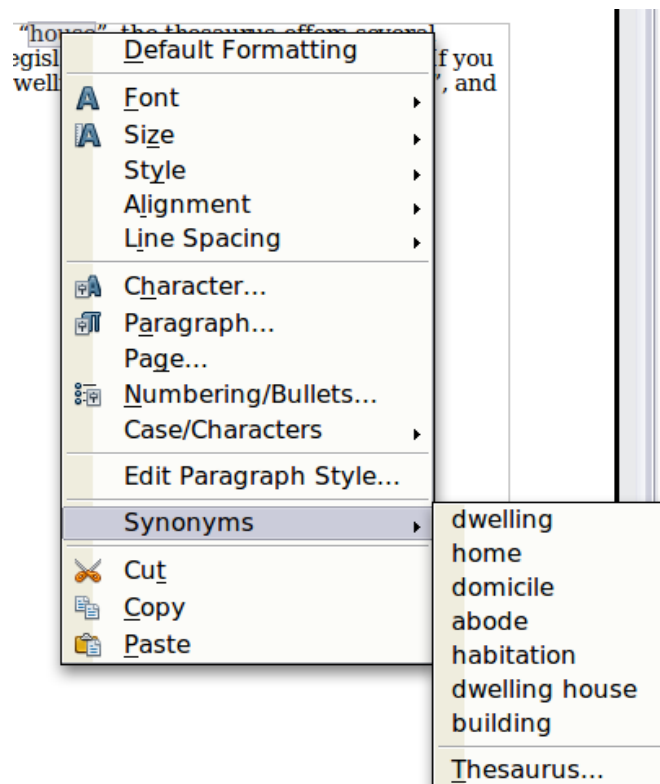

Figure 28: Synonyms on the context menu

- 2) Click on a word or phrase to select it and replace the highlighted word or phrase in the document.

The thesaurus gives a more extensive list of alternative words and phrases. To use the thesaurus:

- 1) Select a word or phrase, and then choose **Tools > Language > Thesaurus**, or press *Control+F7*, or right-click and choose **Thesaurus** from the pop-up menu.
- 2) In the dialog box, click on a meaning to show alternative words and phrases for that meaning of the word.

For example, when given the word *house*, the thesaurus offers several meanings, including *dwelling*, *legislature*, *sign of the zodiac*, and others. If you click on *dwelling*, you will see *dwelling*, *home*, *domicile*, *abode*, and other alternatives, as shown in Figure 29.

### Note

If the current language does not have a thesaurus installed, this feature is disabled.

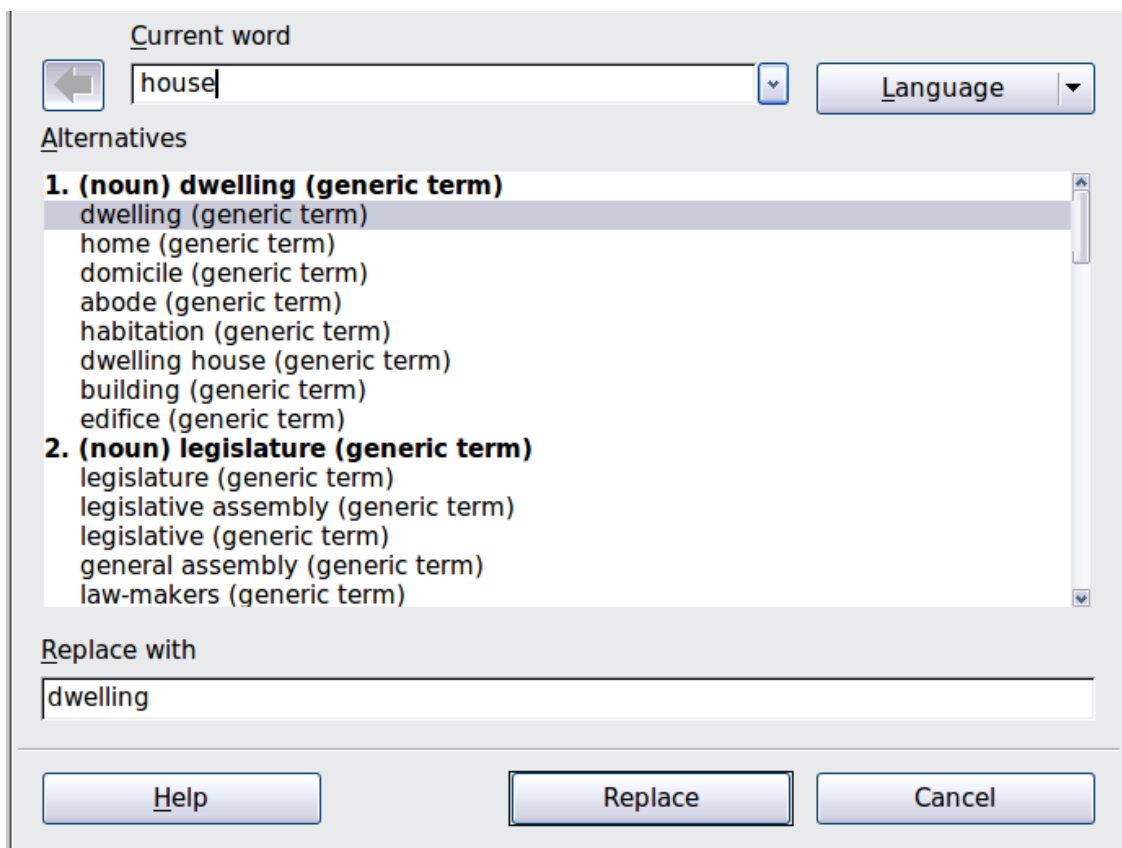

Figure 29: The thesaurus offers alternatives to words

## Hyphenating words

You have several choices regarding hyphenation: let Writer do it automatically (using its hyphenation dictionaries), insert conditional hyphens manually where necessary, or don't hyphenate at all. Each choice has its pros and cons.

### Automatic hyphenation

To turn automatic hyphenation of words on or off:

- 1) Press *F11* to open the Styles and Formatting window. On the *Paragraph Styles* page, right-click on **Default** and select **Modify**.

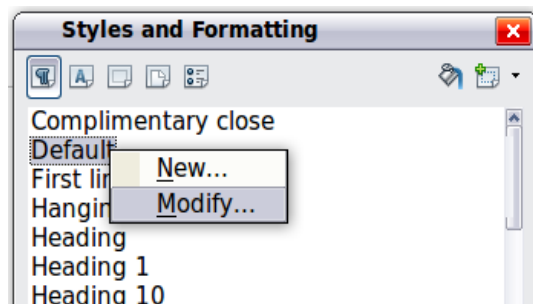

Figure 30: Modifying a paragraph style

- 2) On the Paragraph Style dialog box, select the *Text Flow* tab.

Figure 31: Turning on automatic hyphenation

- 3) Under *Hyphenation*, select or deselect the **Automatically** option.
- 4) Click **OK** to save.

### Note

Turning on hyphenation for the *Default* paragraph style affects all other paragraph styles that are based on *Default*. You can individually change other styles so that hyphenation is not active; for example, you might not want headings to be hyphenated. Any styles that are not based on *Default* are not affected. For more on paragraph styles, see Chapters 6 and 7 in this book.

You can also set hyphenation choices through **Tools > Options > Language Settings > Writing Aids**. In *Options*, near the bottom of the dialog box, scroll down to find the hyphenation settings.

Figure 32: Setting hyphenation options

To change the minimum number of characters for hyphenation, or the minimum number of characters before or after a line break, select the item, and then click the **Edit** button in the Options section.

### Hyphenate without inquiry

Specifies that you will never be asked to manually hyphenate words that the hyphenation dictionary does not recognize. If this box is not selected, when a word is not recognized, a dialog box will open where you can manually enter hyphens.

## Hyphenate special regions

Specifies that hyphenation will also be carried out in footnotes, headers, and footers.

Hyphenation options set in the Writing Aids dialog box are effective only if hyphenation is turned on through paragraph styles.

## Manual hyphenation

To manually hyphenate words, *do not* use a normal hyphen, which will remain visible even if the word is no longer at the end of a line when you add or delete text or change margins or font size. Instead, use a *conditional hyphen*, which is visible only when required.

To insert a conditional hyphen inside a word, click where you want the hyphen to appear and press *Control+hyphen* or use **Insert > Formatting Mark > Optional hyphen**. The word will be hyphenated at this position when it is at the end of the line, even if automatic hyphenation for this paragraph is switched off.

## Using AutoCorrect

Writer's AutoCorrect function has a long list of common misspellings and typing errors, which it corrects automatically. For example, "hte" will be changed to "the".

AutoCorrect is turned on when Writer is installed. To turn it off, uncheck **Format > AutoCorrect > While Typing**.

Select **Tools > AutoCorrect Options** to open the AutoCorrect dialog box. There you can define what strings of text are corrected and how. In most cases, the defaults are fine.

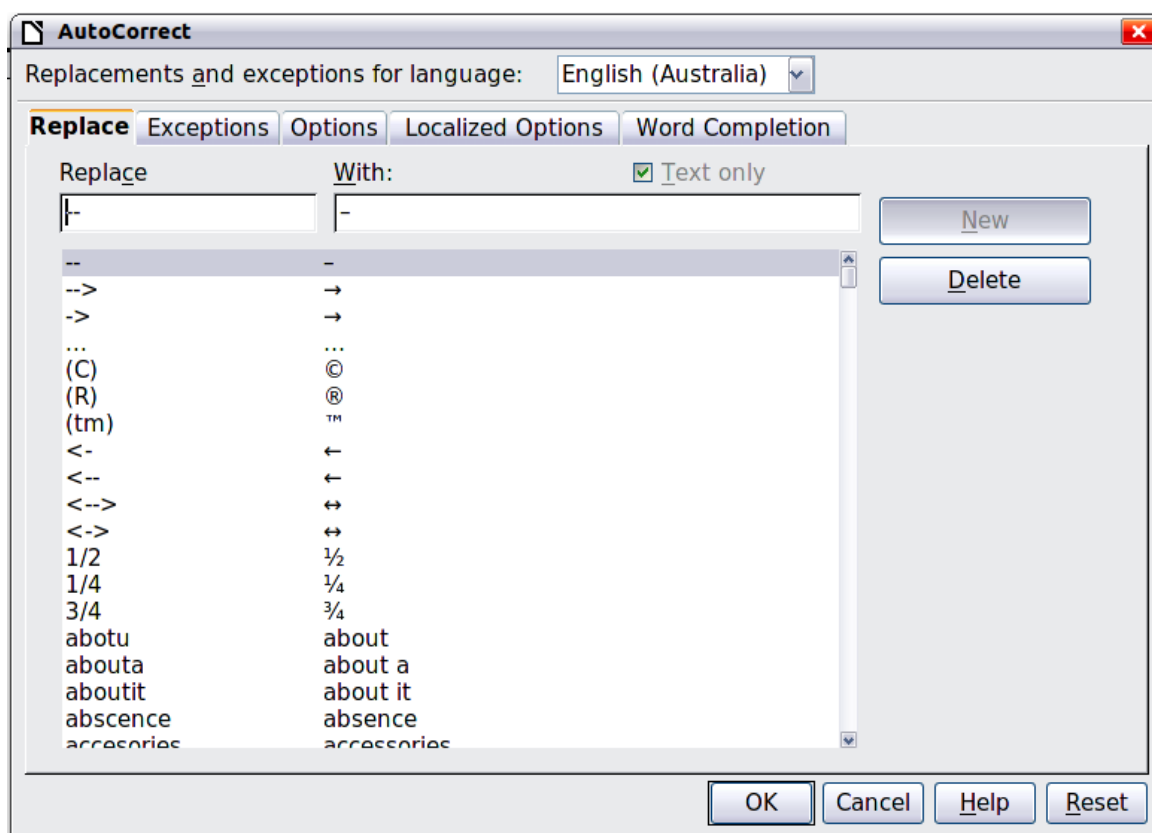

Figure 33: Replace tab of AutoCorrect dialog box

To stop Writer replacing a specific spelling, go to the **Replace** tab, highlight the word pair, and click **Delete**.

To add a new spelling to the list, type it into the *Replace* and *With* boxes on the Replace tab, and click **New**.

See the different pages of the dialog box for the wide variety of other options available to fine-tune AutoCorrect.

### Tip

AutoCorrect can be used as a quick way to insert special characters. For example, (c) will be autocorrected to ©. You can add your own special characters.

## Using word completion

If Word Completion is enabled, Writer tries to guess which word you are typing and offers to complete the word for you. To accept the suggestion, press *Enter*. Otherwise, continue typing.

To turn off Word Completion, select **Tools > AutoCorrect Options > Word Completion** and deselect **Enable word completion**.

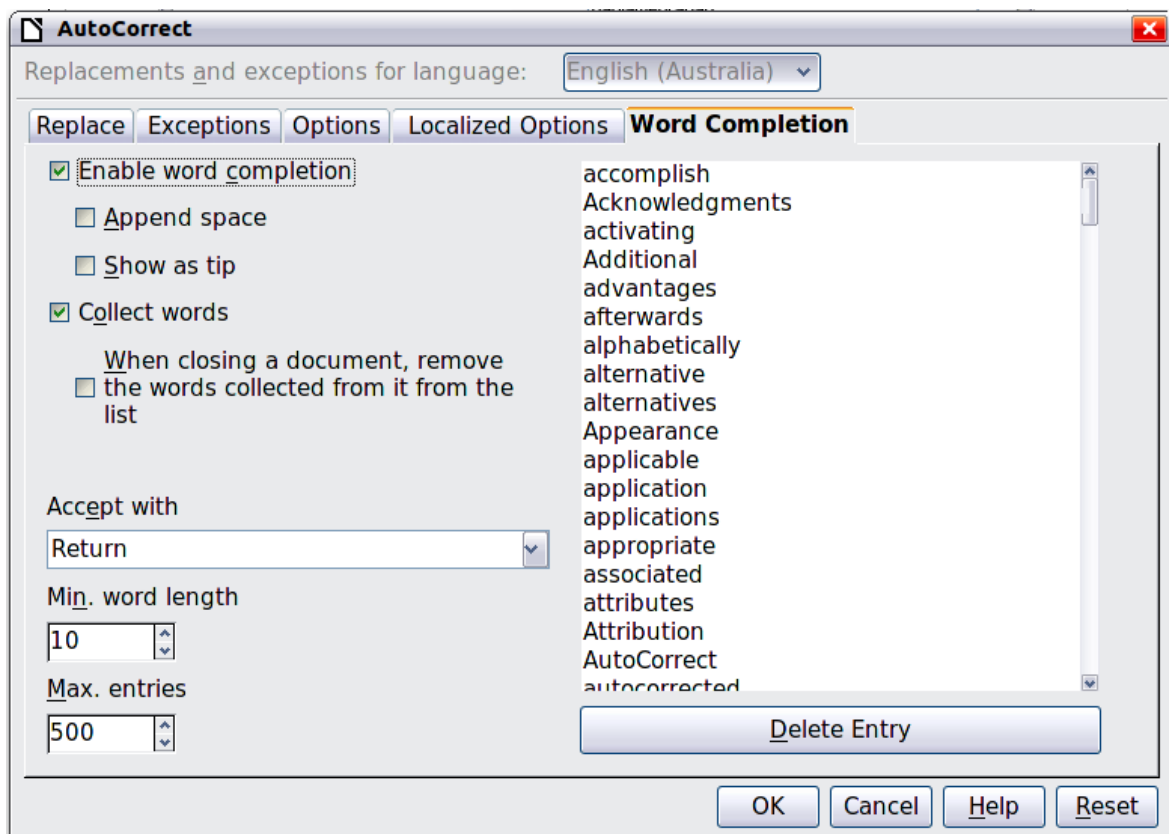

Figure 34: Customizing word completion

You can customize word completion from the *Word Completion* page of the AutoCorrect dialog box.

- Add (append) a space automatically after an accepted word.
- Show the suggested word as a tip (hovering over the word) rather than completing the text as you type.

- Collect words when working on a document, and then either save them for later use in other documents or select the option to remove them from the list when closing the document.
- Change the maximum number of words remembered for word completion and the length of the smallest words to be remembered.
- Delete specific entries from the word completion list.
- Change the key that accepts a suggested entry—the options are *right arrow*, *End* key, *Enter (Return)*, *Space bar*, and *Tab*.

## Note

Automatic word completion only occurs after you type a word for the second time in a document.

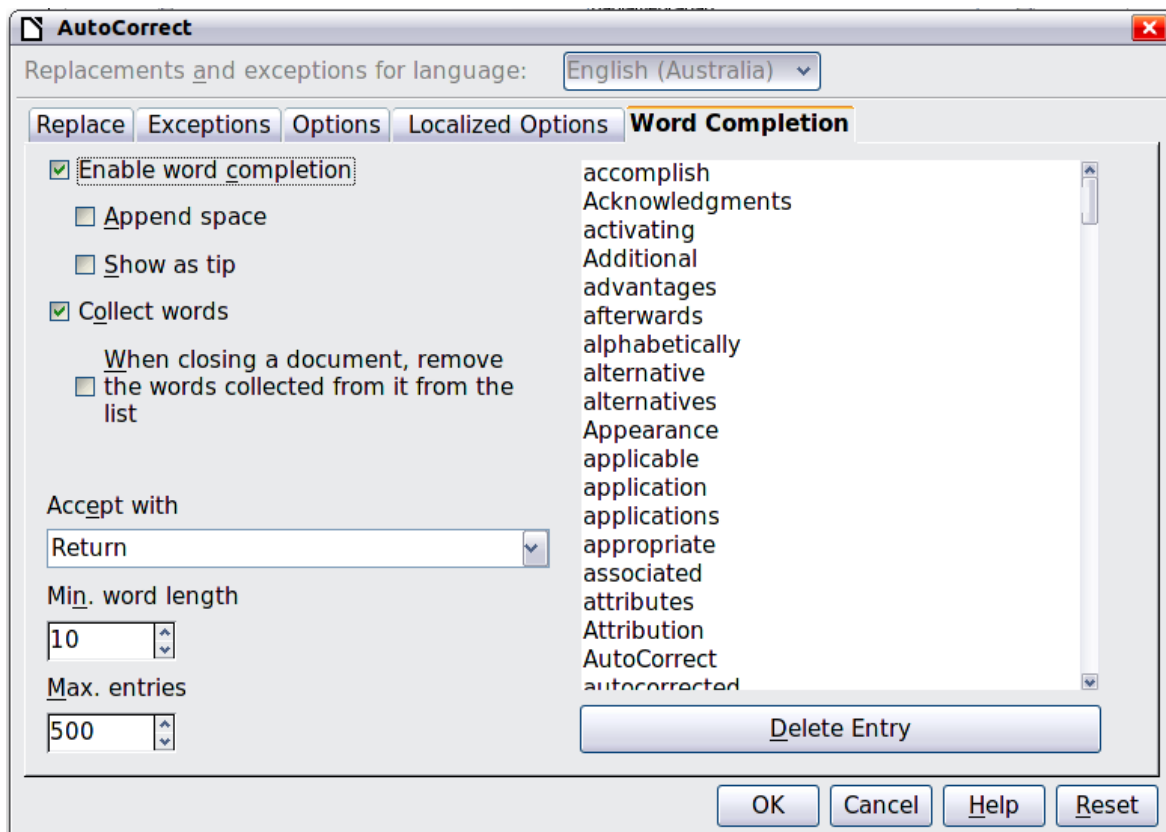

Figure 35: Customizing word completion

## Using AutoText

Use AutoText to store text, tables, fields, and other items for reuse and assign them to a key combination for easy retrieval. For example, rather than typing “Senior Management” every time you use that phrase, you can set up an AutoText entry to insert those words when you type “sm” and press *F3*.

AutoText is especially powerful when assigned to fields. See Chapter 14, Working with Fields, for more information.

## Creating AutoText

To store some text as AutoText:

- 1) Type the text into your document.
- 2) Select the text.
- 3) Go to **Edit > AutoText** (or press *Control+F3*).
- 4) In the AutoText dialog box, type a name for the AutoText in the *Name* box. Writer will suggest a one-letter shortcut, which you can change.
- 5) In the large box to the left, choose the category for the AutoText entry, for example *My AutoText*.
- 6) Click the **AutoText** button on the right of the dialog box and select from the menu either **New** (to have the AutoText retain specific formatting, no matter where it is inserted) or **New (text only)** (to have the AutoText take on the existing formatting around the insertion point..
- 7) Click **Close** to return to your document.

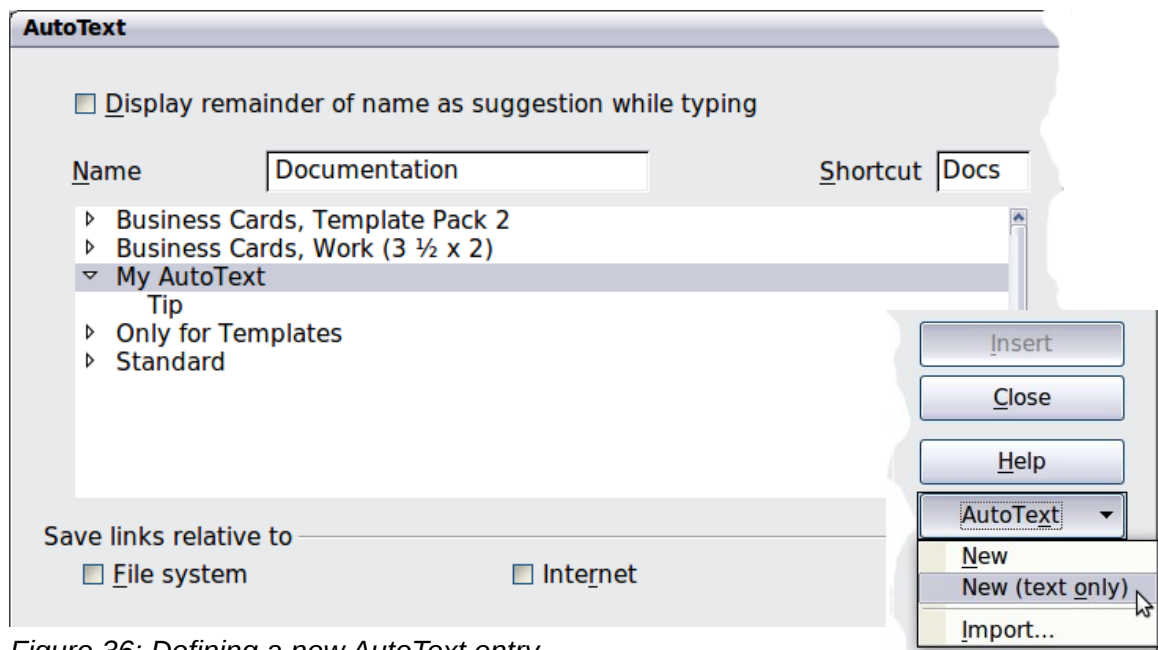

Figure 36: Defining a new AutoText entry

### Tip

If the only option under the **AutoText** button is **Import**, either you have not entered a name for your AutoText or there is no text selected in the document.

To save a table (such as the formatted Tip above) as AutoText:

- 1) Create a table and format it the way you want.
- 2) Select the table.
- 3) Go to **Edit > AutoText** (or press *Control+F3*).
- 4) Type a name for the AutoText, optionally amend the suggested shortcut, and choose the category for the AutoText entry.
- 5) Click the **AutoText** button and select **New** (because you want the formatting of the table preserved).
- 6) Click **Close** to return to your document.

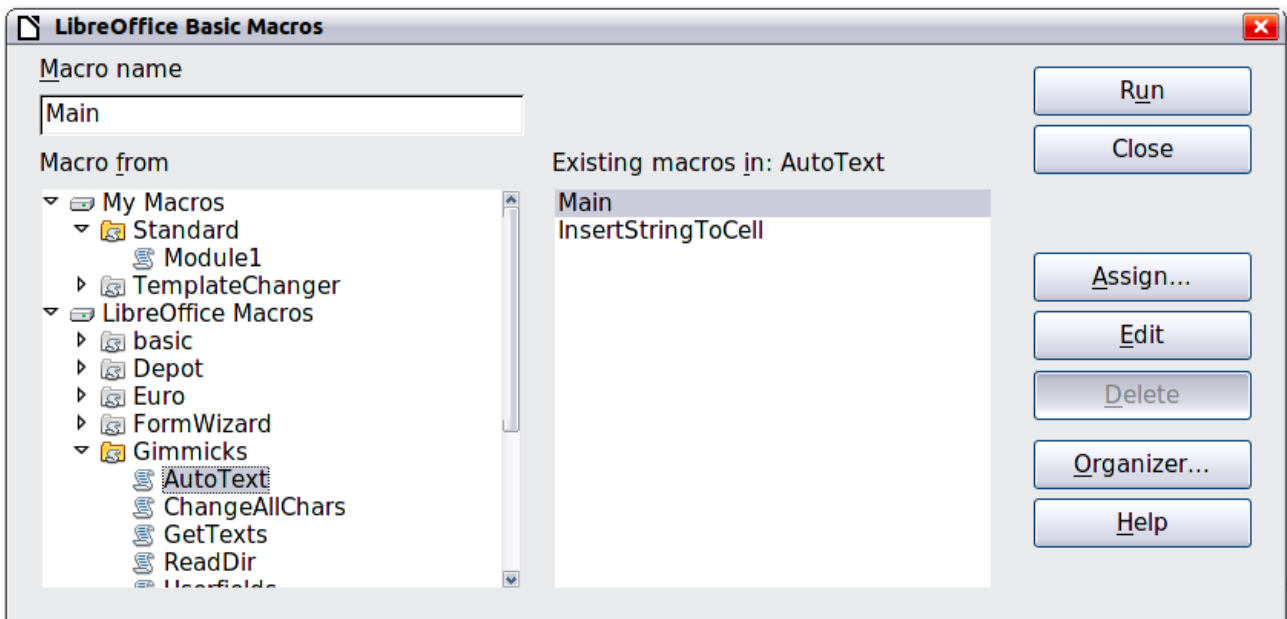

## Inserting AutoText

To insert AutoText, type the shortcut and press **F3**.

## Printing a list of AutoText entries

To print a list of AutoText entries:

- 1) Choose **Tools > Macros > Organize Macros > LibreOffice Basic**.
- 2) In the *Macro from* list, expand **LibreOffice Macros > Gimmicks**.
- 3) Select **AutoText** and then click **Run**. A list of the current AutoText entries is generated in a separate text document. You can then print this document.

## Line numbering

Line numbering puts line numbers in the margin. The line numbers are displayed on screen and are also printed. Figure 37 shows an example with numbering on every line.

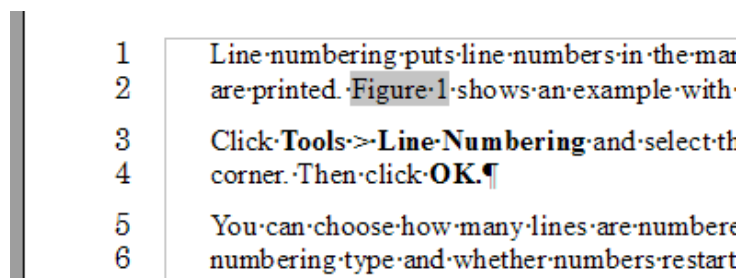

Figure 37: Line numbering example

Click **Tools > Line Numbering** and select the **Show numbering** option in the top left corner of the Line Numbering dialog box (Figure 38). Then click **OK**.

You can choose how many lines are numbered (for example, every line or every tenth line), the numbering type, and whether numbers restart on each page. In addition, a text separator (any text you choose) can be set on a different numbering scheme (one every 12 lines, for example).

Figure 38: The Line Numbering dialog box

## Tracking changes to a document

You can use several methods to keep track of changes made to a document.

- Make your changes to a copy of the document (stored in a different folder, under a different name, or both), then use Writer to combine the two files and show the changes you made. Click **Edit > Compare Document**. This technique is particularly useful if you are the only person working on the document, as it avoids the increase in file size and complexity caused by the other methods.
- Save versions that are stored as part of the original file. However, this method can cause problems with documents of nontrivial size or complexity, especially if you save a lot of versions. Avoid this method if you can.
- Use Writer's change marks (often called "redlines" or "revision marks") to show where you have added or deleted material or changed formatting. Later, you or another person can review and accept or reject each change.

### Tip

Not all changes are recorded. For example, changing a tab stop from align left to align right and changes in formulas (equations) or linked graphics are not recorded.

## Preparing a document for review

When you send a document to someone else to review or edit, you may want to prepare it first so that the editor or reviewer does not have to remember to turn on the revision marks. After you have protected the document, any user must enter the correct password in order to turn off the function or accept or reject changes.

- 1) Open the document. To check whether it contains multiple versions, click **File > Versions**. If multiple versions are listed, save the current version as a separate document with a different name and use this new document as the review copy.
- 2) With the review copy open, make sure that change recording is turned on. The **Edit > Changes > Record** menu item has a check mark next to it when recording is turned on.

- 3) Click **Edit > Changes > Protect Records**. On the Enter Password dialog box, type a password (twice) and click **OK**.

**Tip**

An alternative to steps 2 and 3 above is to choose **File > Properties > Security** tab, select the **Record changes** option, then click **Protect** and enter the password.

## Recording changes

See Chapter 2, Setting up Writer, for instructions on setting up how your changes will be displayed.

- 1) To begin tracking (recording) changes, choose **Edit > Changes > Record**. To show or hide the display of changes, click **Edit > Changes > Show**.

**Tip**

Hold the mouse pointer over a marked change; you will see a *Help Tip* showing the type of change, the author, date, and time of day for the change. If *Extended Tips* are enabled, you will also see any comments recorded for this change.

- 2) To enter a comment on a marked change, place the cursor in the area of the change and then click **Edit > Changes > Comment**.

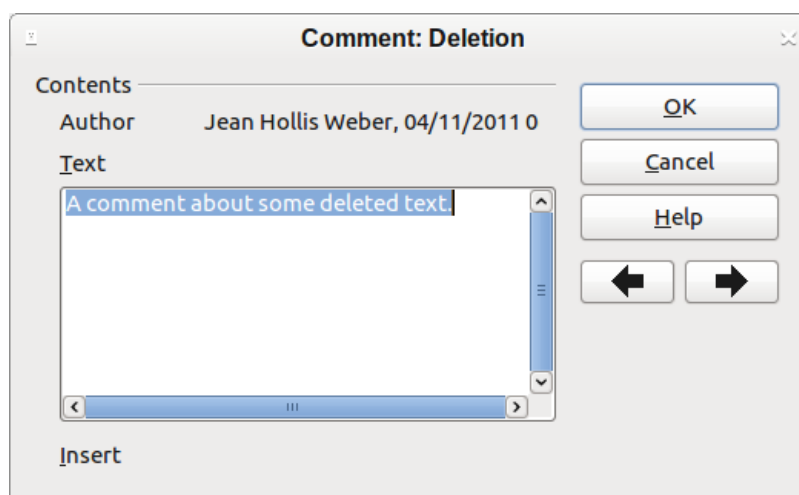

Figure 39: Inserting a comment during change recording

In addition to being displayed as an extended tip, the comment is also displayed in the list in the Accept or Reject Changes dialog box (Figure 40).

To move from one marked change to the next, use the arrow buttons. If no comment has been recorded for a change, the *Text* field is blank.

- 3) To stop recording changes, click **Edit > Changes > Record** again.

**Tip**

See also "Adding other comments" on page 37 for a way to annotate text that is not associated with a recorded change.

## Accepting or rejecting changes

To accept or reject recorded changes, use either of these methods:

- Right-click (context) menu
- Accept or Reject Changes dialog box

The results of accepting or rejecting a change are as follows:

- Accepting an insertion removes the change indicator (usually a color) from the inserted text.
- Rejecting an insertion removes the text from the document.
- Accepting a deletion removes the text from the document.
- Rejecting a deletion removes the change indicator and restores the text to the document.

### Right-click (context) menu

- 1) If recorded changes are not showing, click **Edit > Changes > Show**.
- 2) Hover the mouse pointer over a recorded change. A box appears with information about the type of change, who made it, and the date and time.
- 3) Right-click on the changed text. In the pop-up (context) menu, choose **Accept Change** or **Reject Change**.

### Accept or Reject Changes dialog box

- 1) Click **Edit > Changes > Accept or Reject**. The Accept or Reject Changes dialog box (Figure 40) opens, showing changes that have not yet been accepted or rejected.
- 2) When you select a change in the dialog box, the actual change is highlighted in the document, so you can see what the editor changed.
- 3) Click **Accept** or **Reject** to accept or reject the selected change. You can also click **Accept All** or **Reject All** if you do not want to review the changes individually.

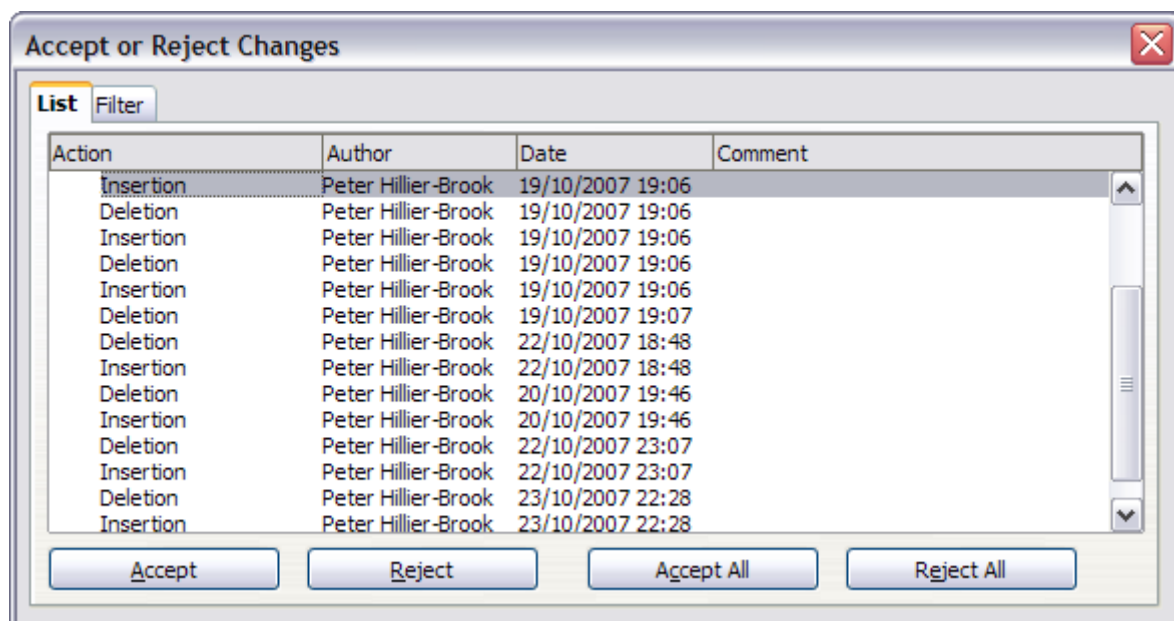

Figure 40: The List tab of the Accept or Reject Changes dialog box

To show only the changes of certain people or only the changes on specific days or various other restrictions, use the *Filter* page (Figure 41) on the Accept or Reject Changes dialog box. After specifying the filter criteria, return to the *List* page to see those changes that meet your criteria.

Figure 41: The Filter page of the Accept or Reject Changes dialog box

## Merging modified documents

The processes discussed to this point are effective when you have one reviewer at a time. Sometimes, however, multiple reviewers all return edited versions of a document at the same time. In this case, it may be quicker to review all of these changes at once, rather than one review at a time. For this purpose, you can merge documents in Writer.

To merge documents, all of the edited documents need to have recorded changes in them.

- 1) Open one copy.
- 2) Click **Edit > Changes > Merge Document** and select and insert another copy of the document to be merged with the first.
- 3) After the documents merge, the Accept or Reject Changes dialog box opens, as in Figure 40, showing changes by more than one reviewer. If you want to merge more documents, close the dialog box and then repeat step 2.
- 4) Repeat until all copies are merged.

All recorded changes are now included in the open copy. Save this file under another name.

## Comparing documents

Sometimes reviewers may forget to record the changes they make. This is not a problem with Writer because you can find the changes if you compare documents.

In order to compare documents, you need to have the original document and the one that is edited. To compare them:

- 1) Open the edited document. Select **Edit > Compare Document**.
- 2) The Insert dialog box appears. Select the original document and click **Insert**.

Writer finds and marks the changes and displays the Accept or Reject Changes dialog box. From this point, you can go through and accept or reject changes procedure as described earlier.

## Adding other comments

Writer provides another type of comments (formerly called “notes”), which authors and reviewers often use to exchange ideas, ask for suggestions, or brainstorm during the review process.

To insert a comment in the text, place the cursor in the place the comment refers to and select **Insert > Comment** or press *Control+Alt+N*. The anchor point of the comment is connected by a dotted line to a box on the right-hand side of the page where you can type the text of the comment. Writer automatically adds at the bottom of the comment the author's name and a time stamp indicating when the comment was created. Figure 42 shows an example of text with comments from two different authors.

Click somewhere on the page to show Writer that you have finished your comment. Otherwise, you will not be able to move away from this location.

Figure 42: Comments in LibreOffice

Select **Tools > Options > LibreOffice > User Data** to configure the name you want to appear in the Author field of the comment, or to change it.

If more than one person edits the document, each author is automatically allocated a different background color.

Right-clicking on a comment pops up a menu where you can delete the current comment, all the comments from the same author, or all the comments in the document. From this menu, you can also apply some basic formatting to the text of the comment. You can also change font type, size, and alignment from the menu bar.

To navigate from one comment to another, open the Navigator (*F5*), expand the Comments section, and click on the comment text to move the cursor to the anchor point of the comment in the document. Right-click on the comment to quickly edit or delete it.

You can also navigate the comments using the keyboard. Use *Control+Alt+Page Down* to move to the next comment and *Control+Alt+Page Up* to move to the previous comment.

## Linking to another part of a document

---

If you type in cross-references to other parts of the document, those references can easily get out of date if you reorganize the order of topics, add or remove material, or reword a heading. Writer provides two ways to ensure that your references are up to date, by inserting links to other parts of the same document or to a different document:

- Hyperlinks
- Cross-references

The two methods have the same result if you *Control+click* the link when the document is open in Writer: you are taken directly to the cross-referenced item. However, they also have major differences:

- The text in a hyperlink does **not** automatically update if you change the text of the linked item (although you can change it manually), but changed text does automatically update in a cross-reference.
- When using a hyperlink, you do not have a choice of the content of the link (for example text or page number), but when using a cross-reference, you have several choices, including bookmarks.
- To hyperlink to an object such as a graphic, and have the hyperlink show useful text such as *Figure 6*, you need to either give such an object a useful name instead of leaving it as the default name (“Graphics6”), or you need to use the Hyperlink dialog box to modify the visible text. In contrast, cross-references to figures with captions automatically show useful text, and you have a choice of several variations of the name.
- If you save a Writer document to HTML, hyperlinks remain active but cross-references do not. (Both remain active when the document is exported to PDF.)

## Using cross-references

To ensure that references update if you reword a heading, caption, or other linked item, use automatic cross-references. See “Using automatic cross-references” in Chapter 14, *Working with Fields*, for details.

## Using bookmarks

Bookmarks are listed in the Navigator and can be accessed directly from there with a single mouse click. In HTML documents, bookmarks are converted to anchors that you can jump to by hyperlink. For more about bookmarks, see “Using bookmarks” in Chapter 14, *Working with Fields*.

## Using hyperlinks

When you type text (such as website addresses or URL) that can be used as a hyperlink, and then press the spacebar or the *Enter* key, Writer automatically creates the hyperlink and applies formatting to the text (usually a color and underlining).

If this does not happen, you can enable this feature using **Tools > AutoCorrect Options > Options** and selecting the **URL Recognition** option.

If you do not want Writer to convert a specific URL to a hyperlink, choose **Edit > Undo Insert** from the menu bar or press *Control+Z* immediately after the formatting has been applied.

You can also insert hyperlinks using the Navigator and the Hyperlink dialog box, and you can modify all hyperlinks using the Hyperlink dialog box, as described in this section.

## Note

Hyperlinks between documents can be set as relative or absolute, using the **Save URLs relative to** option in **Tools > Options > Load/Save > General**.

Relative linking is only possible when the document you are working on and the link destination are on the same drive, and you need to create the same directory structure on your hard disk as will apply on the destination website.

LibreOffice uses absolute path names internally, so when you move your mouse cursor over a hyperlink, the tooltip displays the absolute reference even when it is set to be a relative link.

## Inserting hyperlinks using the Navigator

The easiest way to insert a hyperlink to another part of the same document is by using the Navigator:

- 1) Open the document containing the items you want to cross-reference.
- 2) Open the Navigator (by clicking its icon, choosing **View > Navigator**, or pressing **F5**).
- 3) Click the arrow next to the **Drag Mode** icon, and select **Insert as Hyperlink**.

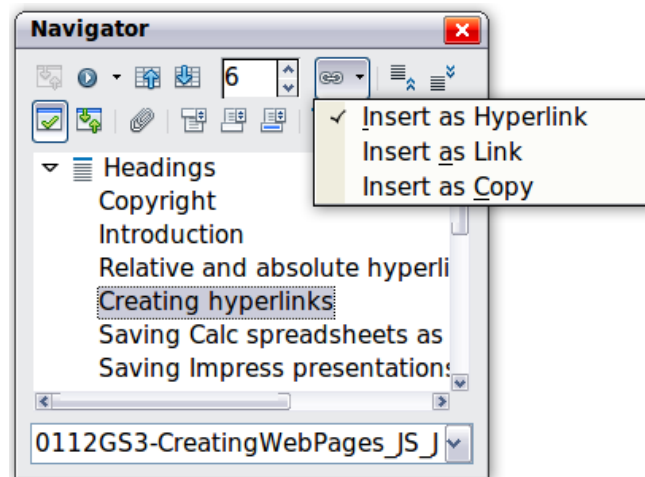

Figure 43: Inserting a hyperlink using the Navigator

- 4) In the list at the bottom of the **Navigator**, select the document containing the item that you want to cross-reference.
- 5) In the **Navigator** list, select the item that you want to insert as a hyperlink.
- 6) Drag the item to where you want to insert the hyperlink in the document. The name of the item is inserted in the document as an active hyperlink.

## Inserting hyperlinks using a dialog box

To display the Hyperlink dialog box (Figure 44), click the **Hyperlink** icon  on the Standard toolbar or choose **Insert > Hyperlink** from the menu bar. To turn existing text into a link, highlight it before opening the dialog box.

On the left hand side, select one of the four types of hyperlink:

- **Internet:** a web address, normally starting with **http://**
- **Mail & News:** for example an email address.
- **Document:** the hyperlink points to another document or to another place in the presentation.
- **New document:** the hyperlink creates a new document.

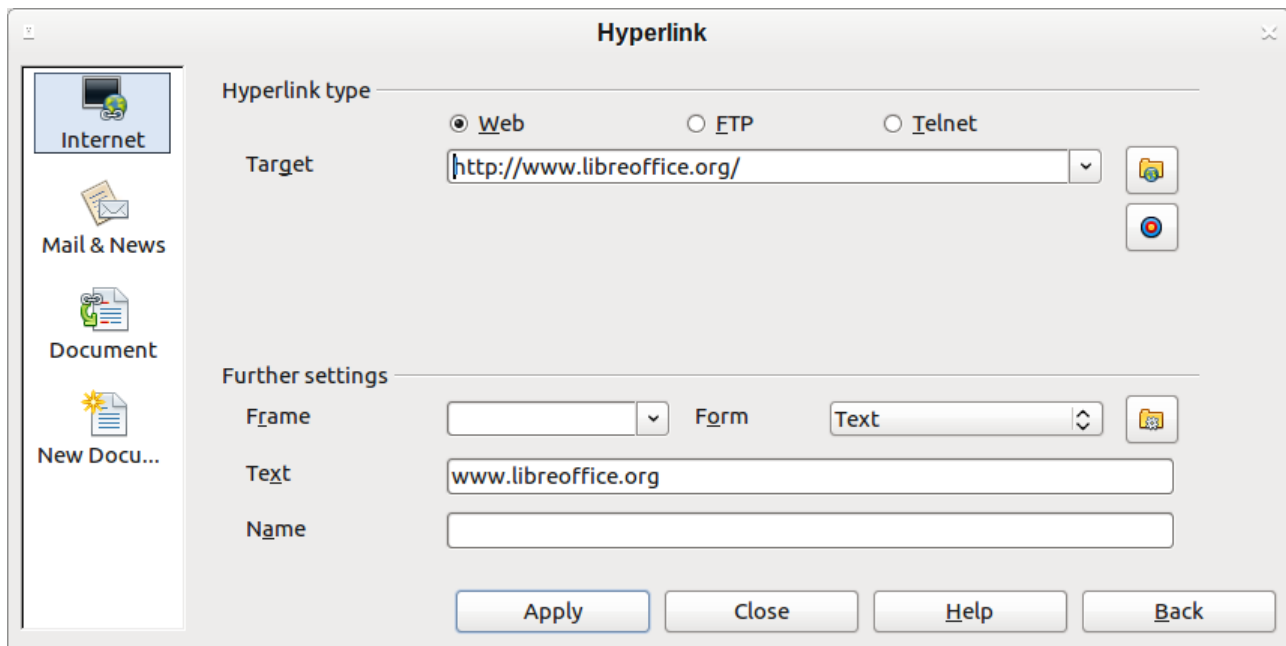

Figure 44. Hyperlink dialog box showing details for Internet links

The top right part of the dialog box changes according to your choice for the hyperlink type. A full description of all the choices, and their interactions, is beyond the scope of this chapter. Here is a summary of the most common choices used in presentations.

For an *Internet* type hyperlink, choose the type of hyperlink (choose between Web, FTP or Telnet), and enter the required web address (URL).

For a *Mail and News* type hyperlink, specify whether it is a mail or news link, the receiver address and for email, also the subject.

For a *Document* type hyperlink, specify the document path (the **Open File** button opens a file browser); leave this blank if you want to link to a target in the same presentation. Optionally specify the target in the document (for example a specific slide). Click on the **Target** icon to open the Navigator where you can select the target, or if you know the name of the target, you can type it into the box.

For a *New Document* type hyperlink, specify whether to edit the newly created document immediately or just create it (**Edit later**) and the type of document to create (text, spreadsheet, and so on). For a text document, **Edit now** is the more likely choice. The **Select path** button opens a directory picker.

The *Further settings* section in the bottom right part of the dialog box is common to all the hyperlink types, although some choices are more relevant to some types of links.

- Set the value of **Frame** to determine how the hyperlink will open. This applies to documents that open in a Web browser.
- **Form** specifies if the link is to be presented as text or as a button.
- **Text** specifies the text that will be visible to the user.
- **Name** is applicable to HTML documents. It specifies text that will be added as a NAME attribute in the HTML code behind the hyperlink.
- **Event** button: this button will be activated to allow LibreOffice to react to events for which the user has written some code (macro). This function is not covered in this book.

## Editing hyperlinks

To edit a hyperlink, click anywhere in the link text and then open the Hyperlink dialog box by clicking the **Hyperlink** icon on the Standard toolbar or choosing **Edit > Hyperlink** from the menu bar. Make your changes and click **Apply**. If you need to edit several hyperlinks, you can leave the Hyperlink dialog box open until you have edited all of them. Be sure to click **Apply** after each one. When you are finished, click **Close**.

The standard (default) behavior for activating hyperlinks within LibreOffice is to use *Control+click*. This behavior can be changed in **Tools > Options > LibreOffice > Security > Options**, by deselecting the option **Ctrl-click required to follow hyperlinks**. If clicking in your links activates them, check that page to see if the option has been deselected.

To change the color of hyperlinks, go to **Tools > Options > LibreOffice > Appearance**, scroll to *Unvisited links* and/or *Visited links*, select those options, pick the new colors and click **OK**. Caution: this will change the color for *all* hyperlinks in *all* components of LibreOffice—this may not be what you want.

In Writer and Calc (but not Draw or Impress), you can also change the *Internet link* character style or define and apply new styles to selected links.

## Switching between insert and overwrite mode

---

In insert mode, any text after the cursor position moves forward to make room for the text you type; in overwrite mode, text after the cursor position is replaced by the text you type. The current mode is displayed on the Status Bar. The shape of the cursor does not change.

With the keyboard, press *Insert* to toggle between overwrite mode and insert mode. With the mouse, click in the area on the Status Bar that indicates the current mode in order to switch to the other mode.

## Counting the words in a selection

---

Select a block of text and choose **Tools > Word Count**. LibreOffice displays the number of words and characters in the selection as well as the number of words in the document. You can also see the number of words and characters (and other information) in the entire document in **File > Properties > Statistics**.

## Changing the case of selected text

---

To quickly change the case of text, select it, choose **Format > Change Case** from the menu bar, and then choose one of the following:

- Sentence case, where only the first word is capitalized (together with any proper nouns)
- lower case, where no words (except proper nouns) are capitalized
- UPPER CASE, where all letters are capitalized
- Capitalize Every Word, where every word is capitalized
- tOGGLE cASE, which changes every letter to the opposite case

There are also several options that are used with Asian text. These are not strictly “Case” changes, but are lumped together in the broader sense of replacing characters with different forms of the same letter. These options are hidden when Asian language support is not enabled.

Writer does not have an automated way to do Title Case, where all words are capitalized except for certain subsets defined by rules that are not universally standardized. To achieve this affect, you can use *Capitalize Every Word* and then restore those words that were incorrectly capitalized.
