Feedback

Please direct any comments or suggestions about this document to the Documentation Team's mailing list: documentation@global.libreoffice.org

Note

Everything you send to a mailing list, including your email address and any other personal information that is written in the message, is publicly archived and cannot be deleted.

Publication date and software version

Published July 2020. Based on LibreOffice 6.4.

Note for macOS users

Some keystrokes and menu items are different on macOS from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this book. For a more detailed list, see the application Help.

<i>Windows or Linux</i>	<i>macOS equivalent</i>	<i>Effect</i>
Tools > Options menu selection	LibreOffice > Preferences	Access setup options
Right-click	Control+click and/or right-click depending on computer setup	Open a context menu
Ctrl (Control)	⌘ (Command)	Used with other keys
F11	⌘+T	Open the sidebar Styles deck

Quick printing

If the **Print Directly** icon is visible on the Standard toolbar, you can click it to send the entire document with the current default print settings. If the icon is not visible, you can show it by right-clicking on the toolbar, pointing to **Visible Buttons**, and selecting **Print Directly**.

To specify default printing settings for LibreOffice Writer, go to **Tools > Options > LibreOffice > Print** and **Tools > Options > LibreOffice Writer > Print**. See Chapter 20, Setting Up Writer.

Controlling printing

For more control over printing, use the Print dialog (**File > Print**, *Ctrl+P* (*⌘+P* for macOS), or the **Print** icon on the Standard toolbar). The appearance of the Print dialog is different on macOS and may include extra printer controls not described in this chapter.

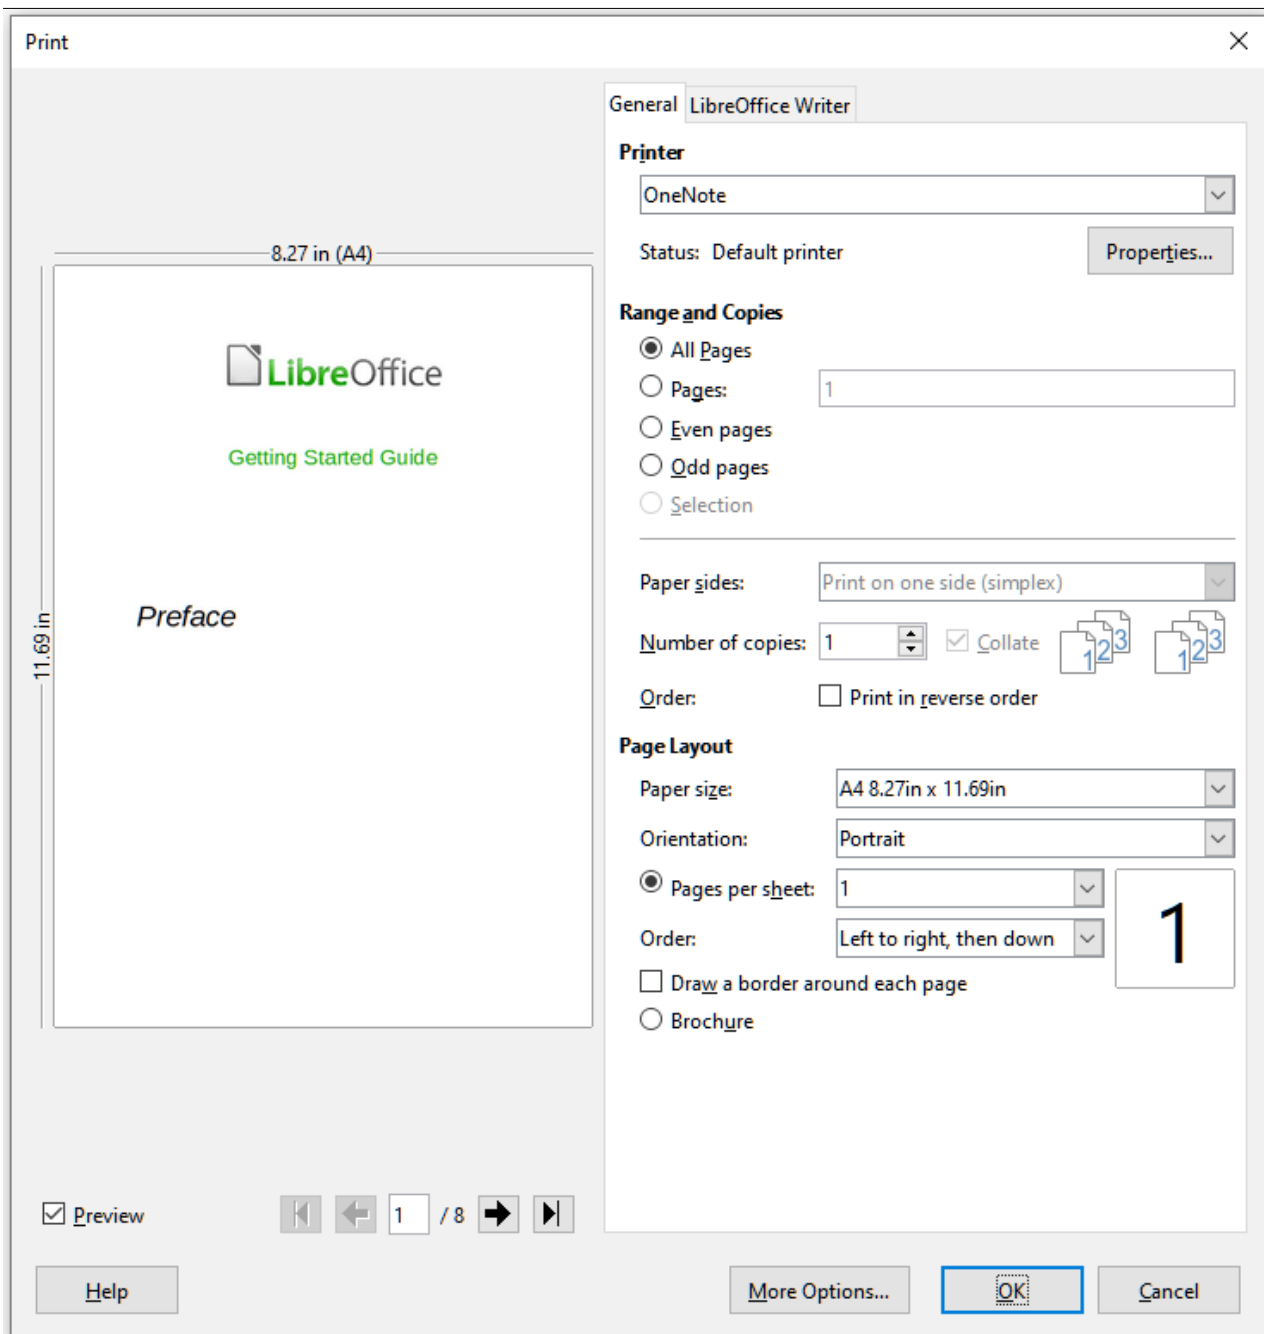

Figure 1: The Print dialog

The Print dialog has two tabs, from which you can choose a range of options, as described in the following sections.

Selecting general printing options

On the *General* page of the Print dialog, you can choose:

- The printer, from the list of available printers.
- Which pages to print, the number of copies to print, and whether to collate multiple copies (*Range and copies* section).
- Paper size and print orientation (*Page Layout* section).
- How many pages to print on one sheet of paper and whether to draw a border around each page (*Page Layout* section).
- Whether to print a brochure (see page 6).
- Whether to print in reverse page order (useful on some printers to make the pages come out in page order).

Selecting printer and print job options

In the *Printer* section of the *General* tab, click the **Properties** button to display the selected printer's properties dialog where you can choose portrait or landscape orientation, which paper tray to use, and the paper size to print on.

Click the **More Options** button at the bottom of the Print dialog to choose whether to create separate print jobs for collated output, instead of one print job containing all the collated pages (not relevant if only one copy of a document is printed).

Printing multiple pages on a single sheet of paper

You can print multiple pages of a document on one sheet of paper. To do this, in the *Page Layout* section of the *General* tab, select **Pages per sheet** and from the drop-down list choose the number of pages to print per sheet of paper. The preview panel on the left of the Print dialog shows how the printed document will look.

When printing more than two pages per sheet, you can choose the order in which they are printed across and down the paper. Figure 2 shows the difference.

Tip

To print two pages per sheet in “facing pages” (book layout) style, print from Print Preview instead. See page 9.

Figure 2: Print order choices

Selecting what to print

In addition to printing a full document, you can choose to print individual pages, a ranges of pages, or a selection from a document.

Printing an individual page:

- 1) In the Print dialog, in the *Range and Copies* section, select the **Pages** option. The text box shows the current page number.
- 2) Enter the page number of the page you want to print. The preview box on the left changes to show the selected page.

Printing a range of pages:

- 1) In the Print dialog, in the *Range and Copies* section, select the **Pages** option.
- 2) Enter the page numbers of the pages to print (for example, 1–4 or 1,3,7,11).

Printing a selection of text or graphics (Writer only):

- 1) In the document, select the material to print, then open the Print dialog.
- 2) In the *Range and Copies* section of the Print dialog, select the now active **Selection** option. The preview box shows the selected material. See Figure 4.

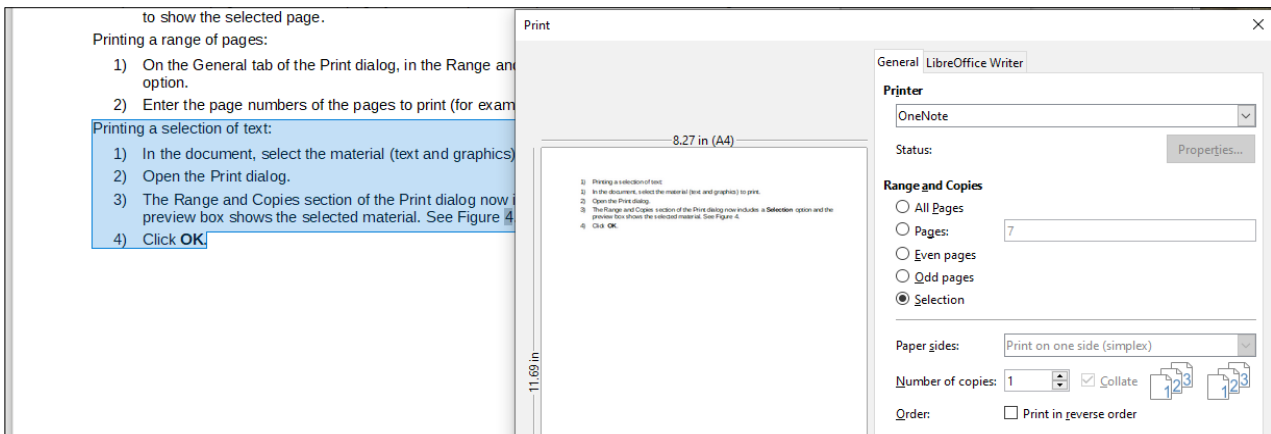

Figure 3: Printing a selection of text

Choices on the LibreOffice Writer tab

On the *LibreOffice Writer* tab (Figure 5) you can choose to print a subset of contents (for example, images or hidden text), print text in black (even if a color is defined for the text), to print automatically inserted blank pages, and where to print any comments that are in the document (Figure 4).

Some selections may not be available all the time. For example, if the document contains no comments, the *Comments* drop-down list is disabled.

Figure 4: Choosing whether and where to print comments

Figure 5: LibreOffice Writer tab of Print dialog

Printing a brochure

In Writer, you can print a document with two pages on each side of a sheet of paper, arranged so that when the printed pages are folded in half, the pages are in the correct order to form a booklet or brochure.

Tip

Plan your document so it will look good when printed half size; choose appropriate margins, font sizes, and so on. You may need to experiment.

To print a brochure on a single-sided printer:

- 1) Select the **Brochure** option near the bottom of the *General* tab of the Print dialog. The preview on the left changes to show the sequence in which the pages will be printed. (See Figure 6.)
- 2) Depending on your language settings (**Tools > Options > Language Settings > Languages**), the Print dialog may include a drop-down menu adjacent to the **Brochure** button (not shown in Figure 6). This provides *Left-to-right script* and *Right-to-left script* options. Select the required setting in this menu.
- 3) In the *Range and Copies* section, select **Even pages**. Click **OK** to print.
- 4) Take the printed pages out of the printer and put them back into the printer in the correct orientation to print on the blank side. You may need to experiment to find the correct arrangement for your printer.
- 5) On the Print dialog, in the *Range and Copies* section, select **Odd pages**. Click **OK**.

Tip

If your printer can print double-sided (duplex) automatically, choose **All pages**.

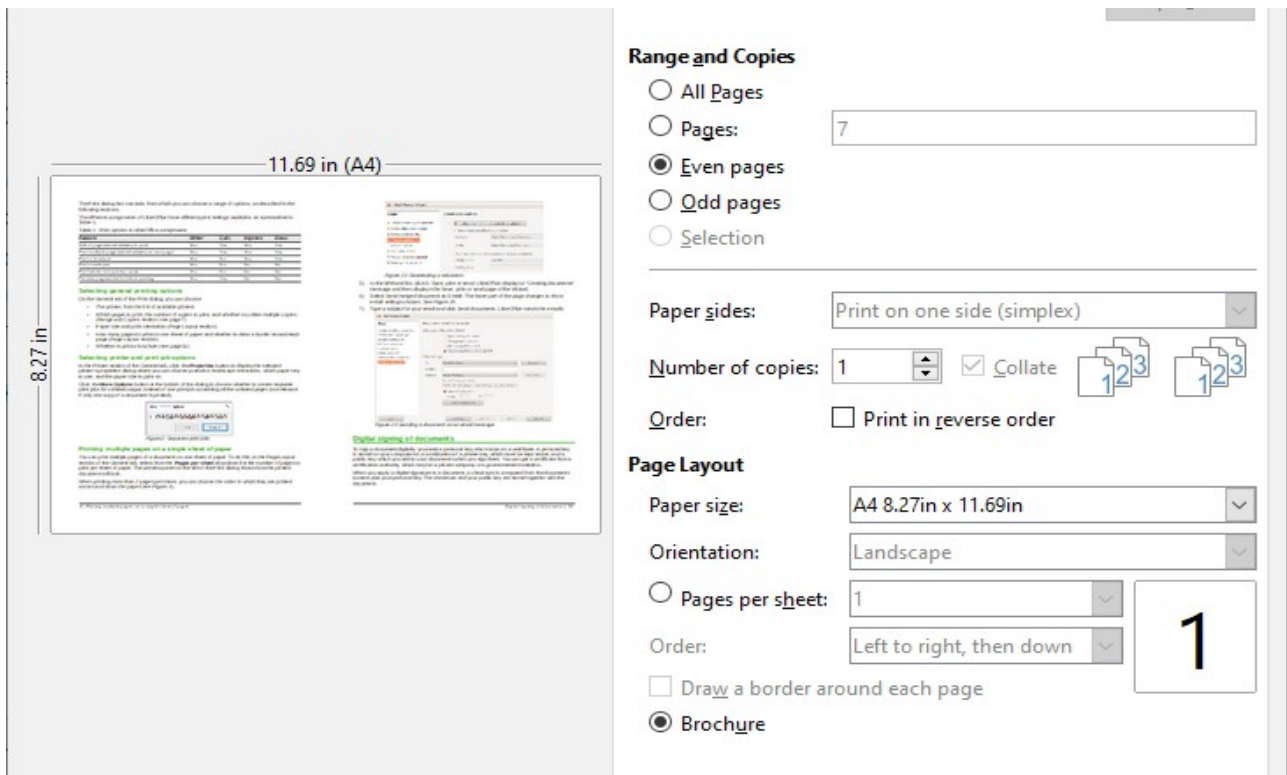

Figure 6: Settings for printing a brochure on a simplex printer

Printing in black and white (on a color printer)

You may wish to print documents in black and white on a color printer. Several choices are available.

Note

Some color printers may print in color regardless of the settings you choose.

For one document, change the printer settings to print in black and white or grayscale:

- 1) On the Print dialog, click **Properties** to open the Properties dialog for the printer. The available choices vary from one printer to another, but you should find options for the color settings. See your printer's help or user manual for more information.
- 2) The choices for color might include black and white or grayscale. Choose grayscale.
- 3) Click **OK** to confirm your choice and return to the Print dialog,
- 4) Click **OK** to print the document.

To print all color text and images as grayscale, change the LibreOffice settings:

- 1) Choose **Tools > Options > LibreOffice > Print**.
- 2) Select the **Convert colors to grayscale** option. Click **OK** to save the change.

To print all color text as black, and all images as grayscale, change the LibreOffice Writer settings:

- 1) Choose **Tools > Options > LibreOffice Writer > Print**.
- 2) Under **Contents**, select the **Print text in black** option. Click **OK** to save the change.

Previewing pages before printing

The normal page view in Writer shows what each page will look like when printed; you can edit the pages in that view. If you are designing a document to be printed double-sided, you may want to see what facing pages look like. Writer provides two ways to do this:

- **View Layout** (editable view): use the **Book View** button on the status bar and (usually) zoom out.

- **Print Preview** (read-only view).

To use Print Preview:

- 1) Choose **File > Print Preview** on the Menu bar, or click the **Toggle Print Preview** icon on the Standard toolbar, or press *Ctrl+Shift+O*. Writer now displays the Print Preview toolbar instead of the Formatting toolbar.

- 2) Select the required preview icon: **Single Page**, **Two Pages**, **Book Preview**, or **Multiple Pages**.
- 3) To print the document from this view, click the **Print** icon to open the Print dialog. Choose the print options and click **OK**.

Printing envelopes

Printing envelopes involves two steps: setup and printing.

To set up an envelope to be printed by itself or with a document:

- 1) Click **Insert > Envelope** from the Menu bar.
- 2) In the Envelope dialog, start with the *Envelope* tab (Figure 7). Verify, add, or edit the information in the Addressee and Sender (the “from” on the envelope) boxes. The sender information is picked up from the User Data page in **Tools > Options > LibreOffice**.
You can type information directly into the Addressee and Sender boxes, or use the right-hand drop-down lists to select the database or table from which you can draw the envelope information. See Chapter 14, Mail Merge, for details on how to print envelopes from a database.
- 3) On the *Format* tab (Figure 8), verify or edit the positioning of the addressee and the sender information. The preview area on the lower right illustrates your choices.
- 4) To format the text of these blocks, click the **Edit** button to the right. In the drop-down list you have two choices: **Character** and **Paragraph**.
 - Select **Character** to open a dialog similar to the standard Character dialog, where you can set the formatting of the text.
 - Select **Paragraph** to open a dialog similar to the standard Paragraph dialog, where you can set the paragraph's attributes.
- 5) In the lower left of this tab is the *Size* section. Choose the envelope format from the drop-down list. The width and height of the selected envelope show in the boxes below the selected format. If you chose a pre-existing format, just verify these sizes. If you chose User defined in the Format list, then you can edit the sizes.

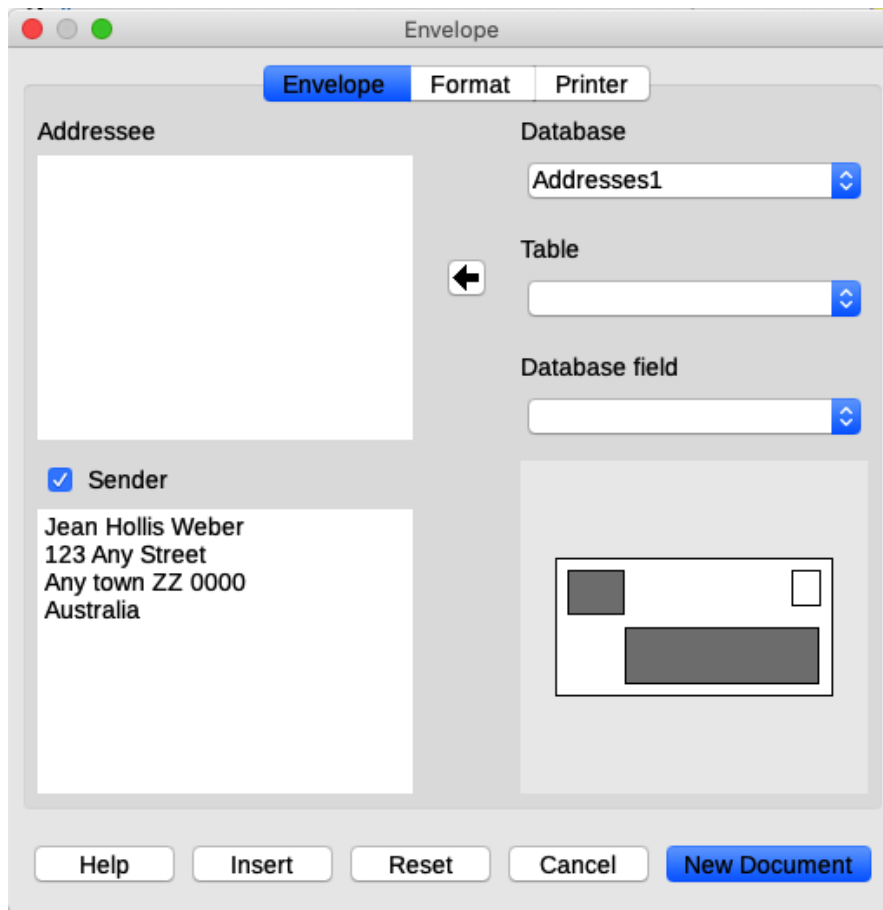

Figure 7: Choosing addressee and sender information for an envelope

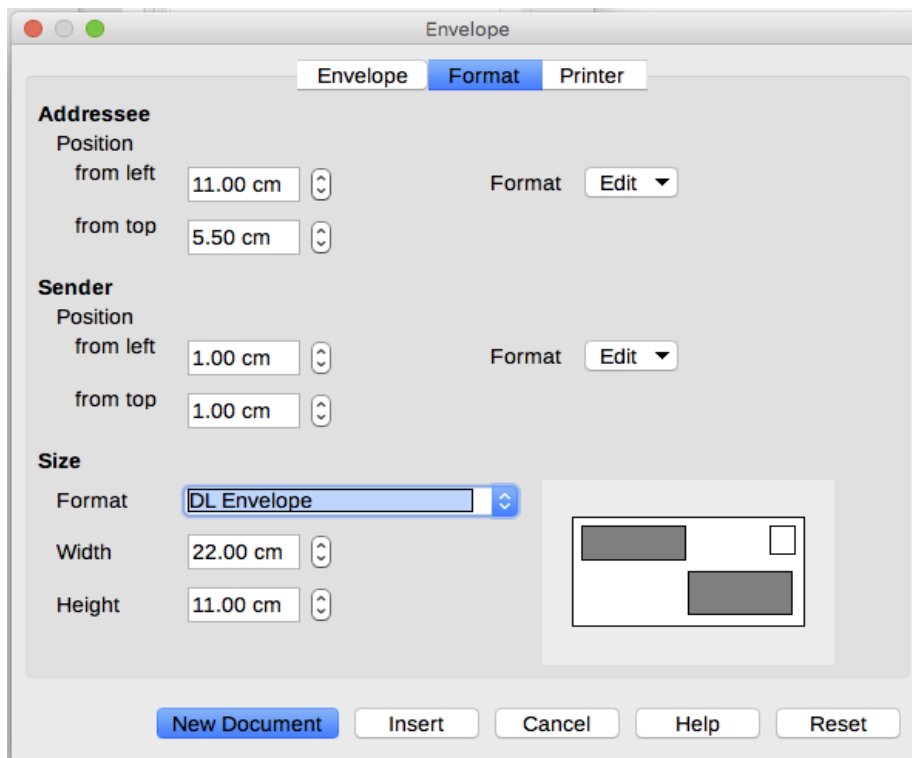

Figure 8: Choosing positioning and size of elements for an envelope

- 6) After formatting, go to the *Printer* tab (Figure 9) to choose which printer to use, its setup (for example, specification of the tray holding envelopes), and other printer options such as envelope orientation and shifting. You may need to experiment to see what options work best for your printer, as well as how the envelopes need to be positioned in the printer.

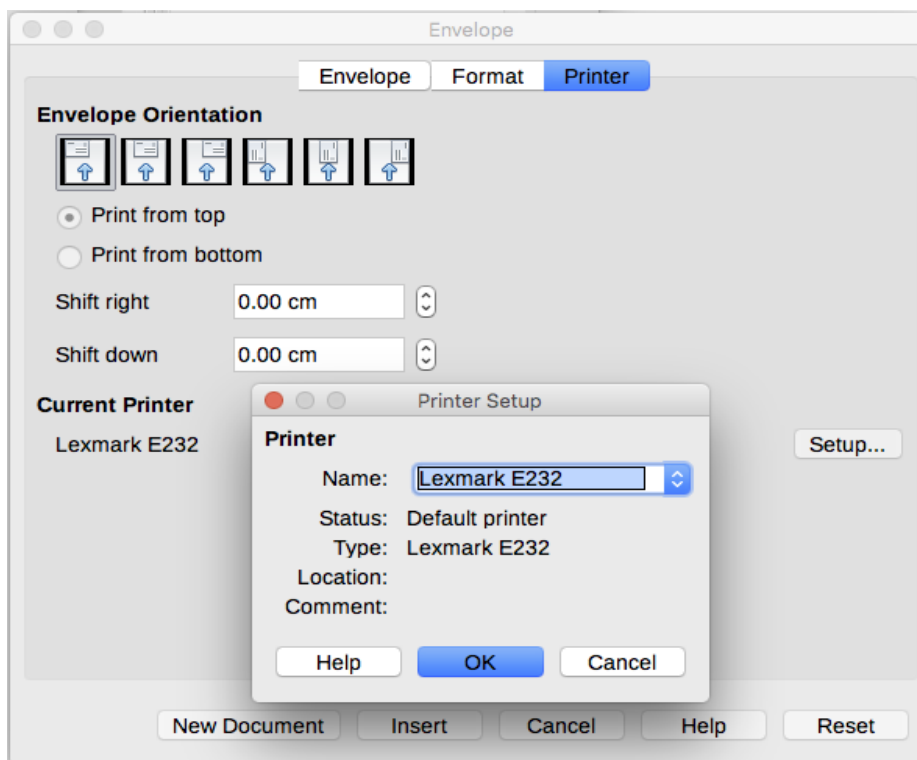

Figure 9: Choosing printer options for an envelope

- 7) When you have finished formatting and are ready to print, click either the **New Document** button or the **Insert** button to finish. *New Document* makes only an envelope or starts a new document with the envelope. *Insert* puts the envelope into your existing document as page 1.
- 8) Save this file before you do anything else.

To print the envelope:

- 1) Choose **File > Print** from the Menu bar.
- 2) On the Print dialog, under *Range and Copies*, choose **Pages** and type **1** in the box. Choose the required printer (which may be different from the usual printer). Click **OK** to print.

Printing labels

Labels are commonly used for printing address lists (where each label shows a different address), but they can also be used to make multiple copies of one label, for example return-address stickers, labels for CDs/DVDs, or other items.

Printing labels, like printing envelopes, has two steps: setup and printing. This topic is covered in detail in Chapter 14, Mail Merge.

Exporting to PDF

LibreOffice can export documents to PDF (Portable Document Format). This standard file format is ideal for sending the file to someone else to view using Adobe Reader or other PDF viewers.

Warning

A document in PDF format is not protected against contents tampering or editing by default. The PDF document contents can be edited by specialized software tools, including LibreOffice Draw.

Tip

Unlike Save As, the Export command writes a copy of the current document in a new file with the chosen format, but keeps the current document and format open in your session.

Quick export to PDF

Click the **Export Directly as PDF** icon in the Standard toolbar, or **File > Export As > Export Directly as PDF**, to export the entire document using the PDF settings you most recently selected in the PDF Options dialog. You are asked to enter the file name and location for the PDF, but you do not get a chance to choose a page range, the image compression, or other options.

Controlling PDF content and quality

For more control over the content and quality of the resulting PDF, use **File > Export as > Export as PDF**. The PDF Options dialog opens. This dialog has six pages (*General, Initial View, User Interface, Links, Security, and Digital Signatures*). Select the appropriate settings, and then click **Export**. Then you are asked to enter the location and file name of the PDF to be created, and click **Save** or **Export**.

Note

Another choice is to use **File > Export**. This opens the Export dialog. Select the PDF file format, file name and location, and click **Save** or **Export**. This opens the PDF Options dialog. Click **Export** when all the selections have been made. The only difference between the two export methods is the sequence in which steps occur.

General tab of PDF Options dialog

On the *General* tab (Figure 12), you can choose which pages to include in the PDF, the type of compression to use for images (which affects the quality of images in the PDF), and other options.

Range section

- **All:** Exports the entire document.
- **Pages:** To export a range of pages, use the format 3-6 (pages 3 to 6). To export single pages, use the format 7;9;11 (pages 7, 9 and 11). You can also export a combination of page ranges and single pages, by using a format like 3-6;8;10;12.
- **Selection:** Exports whatever material is selected.
- **View PDF after export:** Your default PDF viewer will open and display the newly exported PDF.

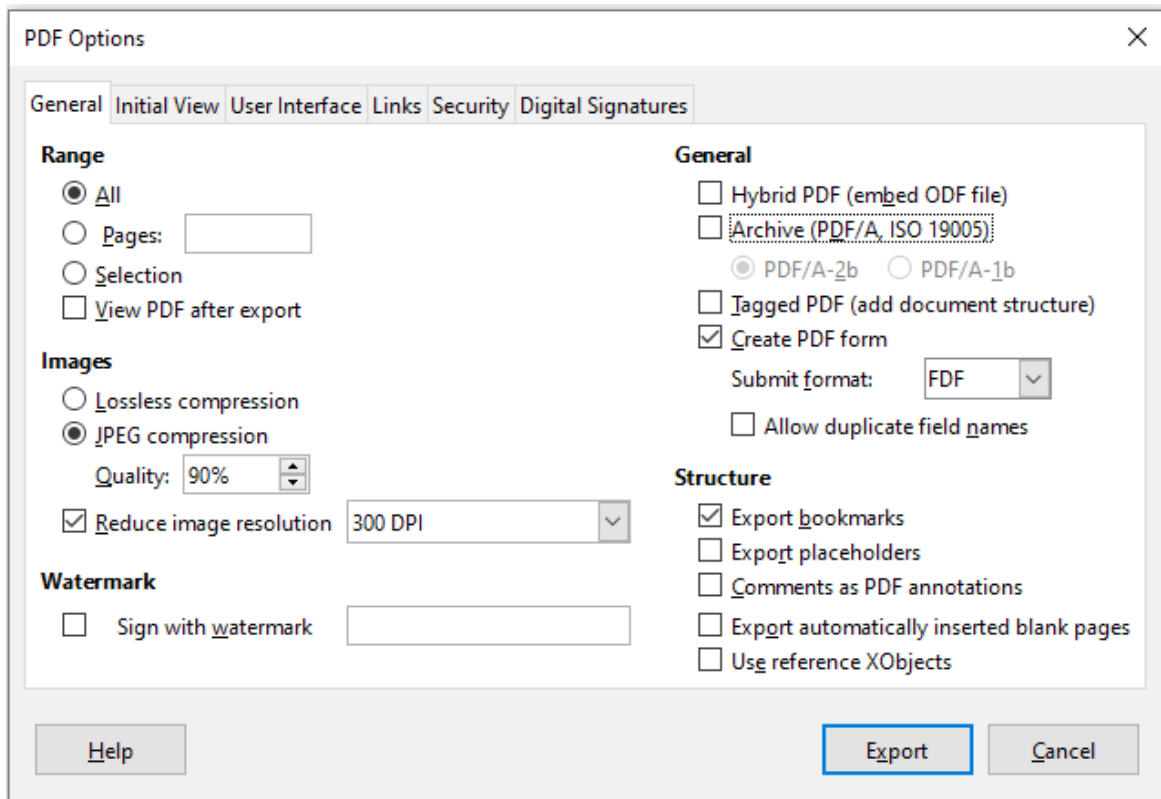

Figure 10: General tab of PDF Options dialog

Images section

- **Lossless compression:** Images are stored without any loss of quality. Tends to make large files when used with photographs. Recommended for other kinds of images or graphics.
- **JPEG compression:** Allows for varying degrees of quality. A setting of 90% works well with photographs (small file size, little perceptible loss of quality).
- **Reduce image resolution:** Lower-DPI (dots per inch) images have lower quality. For viewing on a computer screen generally a resolution of 72dpi (for Windows) or 96dpi (GNU/Linux) is sufficient, while for printing it is generally preferable to use at least 300 or 600 dpi, depending on the capability of the printer. Higher dpi settings increase the size of the exported file.

Note

EPS (Encapsulated PostScript) images with embedded previews are exported only as previews. EPS images without embedded previews are exported as empty placeholders.

Watermark section

- **Sign with Watermark:** When this option is selected, a transparent overlay of the text you enter into the Watermark Text box will appear on each page of the PDF.

General section

- **Hybrid PDF (embed ODF file):** Use this setting to export the document as a PDF file containing two file formats: PDF and ODF. In PDF viewers it behaves like a normal PDF file, and it remains fully editable in LibreOffice.
- **Archive PDF/A (ISO 19005):** PDF/A is an ISO standard for long-term preservation of documents, by embedding all the information necessary for faithful reproduction (such as fonts) while forbidding other elements (including forms, security, and encryption). PDF tags are written. If you select PDF/A-1a, the forbidden elements are grayed-out (not available).

- **Tagged PDF:** Tagged PDF contains information about the structure of the document's contents. This can help to display the document on devices with different screens, and when using screen reader software. Some tags that are exported are table of contents, hyperlinks, and controls. This option can increase file sizes significantly.
- **Create PDF form – Submit format:** Choose the format of submitting forms from within the PDF file. This setting overrides the control's URL property that you set in the document. There is only one common setting valid for the whole PDF document: PDF (sends the whole document), FDF (sends the control contents), HTML, and XML. Most often you will choose the PDF format.
- **Allow duplicate field names:** If enabled, the same field name can be used for multiple fields in the generated PDF file. With this option enabled, you can enter data in the first occurrence of the named field in the PDF document and all fields with the same name will carry your entry. If disabled, field names will be exported using generated unique names.

Structure section

- **Export bookmarks:** Exports headings as “bookmarks” (a table of contents list displayed by most PDF viewers, including Adobe Reader).
- **Export placeholders:** The PDF will include any defined placeholder fields, which can be filled in by users.
- **Comments as PDF annotations:** You may not want this!
- **Export automatically inserted blank pages:** If selected, automatically inserted blank pages are exported to the PDF. This is best if you are printing the PDF double-sided. For example, books usually have chapters set to always start on an odd-numbered (right-hand) page. When the previous chapter ends on an odd page, Writer inserts a blank page between the two odd pages. This option controls whether to export that blank page.
- **Use reference XObjects:** If you don't know what this means, leave this box unchecked.

Initial View tab of PDF Options dialog

On the *Initial View* tab (Figure 11), you can choose how the PDF opens by default in a PDF viewer. The selections should be self-explanatory.

If you have Complex Text Layout enabled (in **Tools > Options > Language settings > Languages**), an additional selection is available under the **Continuous facing** button: First page is left (normally, the first page is on the right when using the Continuous facing option).

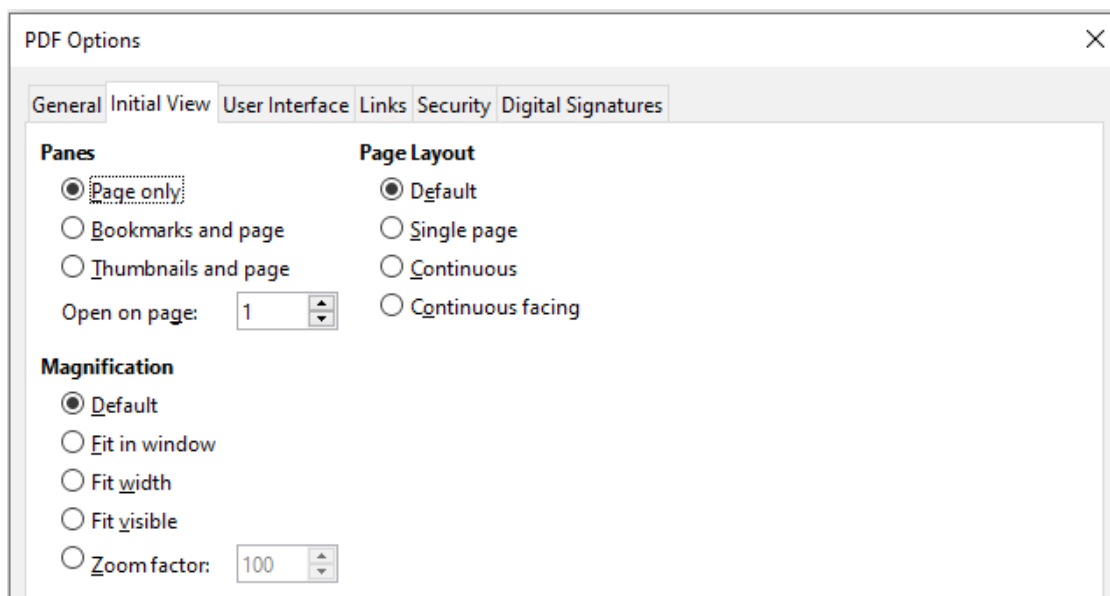

Figure 11: Initial View tab of PDF Options dialog

User Interface tab of PDF Options dialog

On the *User Interface* tab (Figure 12), you can choose more settings to control how a PDF viewer displays the file. Some of these choices are particularly useful when you are creating a PDF to be used as a presentation or a kiosk-type display.

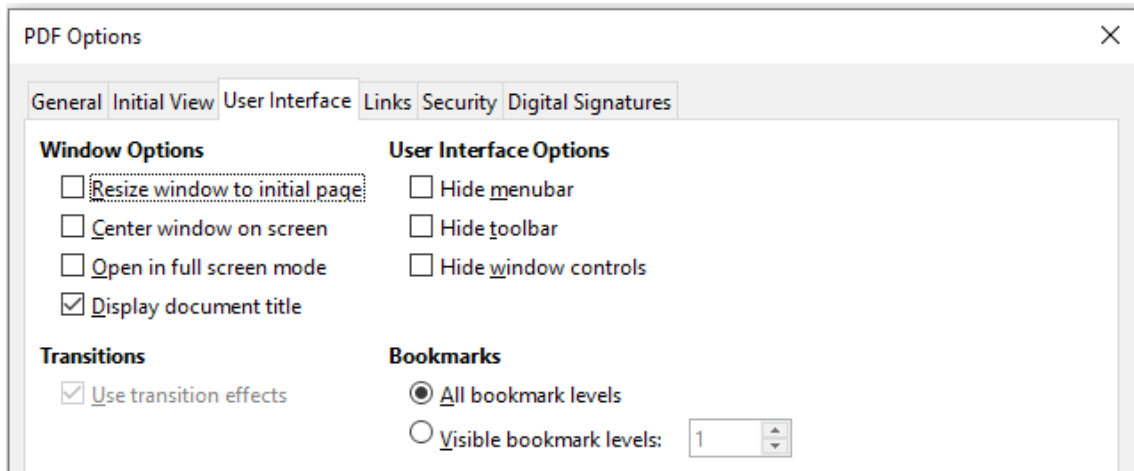

Figure 12: User Interface tab of PDF Options dialog

Window options section

- **Resize window to initial page.** Causes the PDF viewer window to resize to fit the first page of the PDF.
- **Center window on screen.** Causes the PDF viewer window to be centered on the computer screen.
- **Open in full screen mode.** Causes the PDF viewer to open full-screen instead of in a smaller window.
- **Display document title.** Causes the PDF viewer to display the document's title in the title bar.

User interface options section

- **Hide menubar.** Causes the PDF viewer to hide the Menu bar.
- **Hide toolbar.** Causes the PDF viewer to hide the toolbar.
- **Hide window controls.** Causes the PDF viewer to hide other window controls.

Transitions

Not available in Writer.

Bookmarks

Select how many heading levels are displayed as bookmarks, if Export bookmarks is selected on the *General* page.

Links tab of PDF Options dialog

On the *Links* tab, you can choose how links in documents are exported to PDF.

Export bookmarks as named destinations

If you have defined Writer bookmarks, this option exports them as “named destinations” to which Web pages and PDF documents can link.

Convert document references to PDF targets

If you have defined links to other documents with OpenDocument extensions (such as .odt, .ods, and .odp), this option converts the file extensions to .pdf in the exported PDF document.

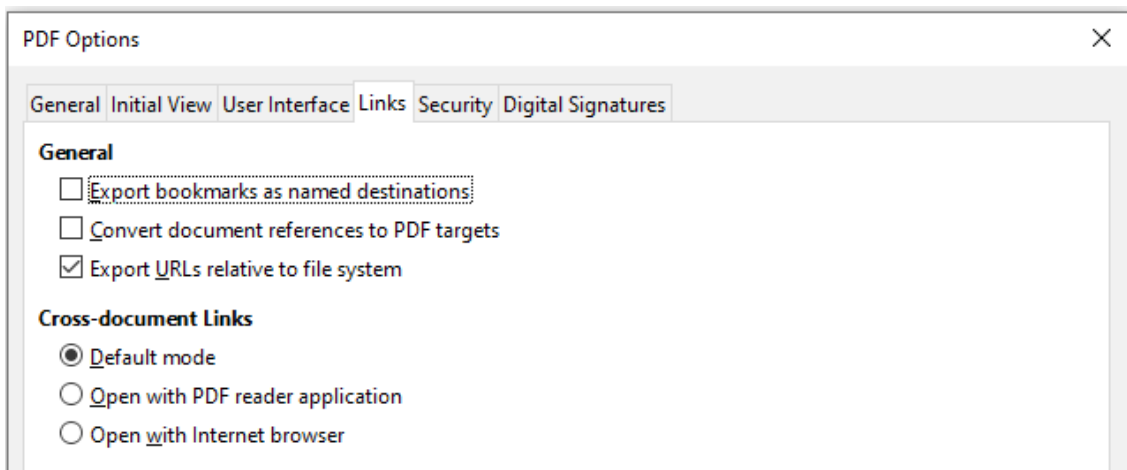

Figure 13: Links tab of PDF Options dialog

Export URLs relative to the file system

If you have defined relative links in a document, this option exports those links to the PDF.

Cross-document links

Defines the behavior of links clicked in PDF files. Select one of the alternatives:

- *Default mode*: The PDF links will be handled as specified in your operating system.
- *Open with PDF reader application*: Use the same application used to display the PDF document to open linked PDF documents.
- *Open with Internet browser*: Use the default Internet browser to display linked PDF documents.

Security tab of PDF Options dialog

PDF export includes options to encrypt the PDF (so it cannot be opened without a password) and apply some digital rights management (DRM) features.

- With an *open password* set, the PDF can only be opened with the password. Once opened, there are no restrictions on what the user can do with the document (for example, print, copy, or change it).
- With a *permissions password* set, the PDF can be opened by anyone, but its permissions can be restricted. See Figure 14. After you set a password for permissions, the other choices on the Security page become available.
- With *both* the open password and permission password set, the PDF can only be opened with the correct password, and its permissions can be restricted.

Note

Permissions settings are effective only if the user's PDF viewer respects the settings.

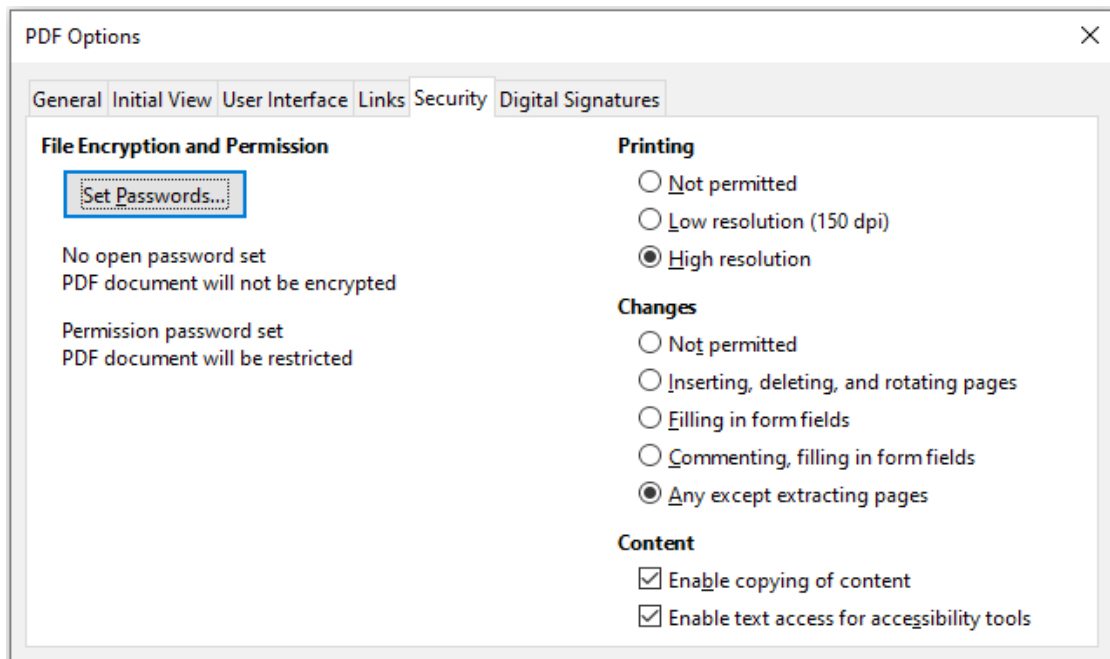

Figure 14: Security tab of PDF Options dialog with passwords set

Digital Signatures tab of PDF Options dialog

The *Digital Signatures* tab (Figure 15) contains the options related to exporting a digitally signed PDF.

Digital signatures are used to ensure that the PDF was really created by the original author (that is, you), and that the document has not been modified since it was signed.

The signed PDF export uses the keys and X.509 certificates already stored in your default key store location or on a smartcard. The key store to be used can be selected under **Tools > Options > LibreOffice > Security > Certificate Path**. When using a smartcard, it must already be configured for use by your key store. This is usually done during installation of the smartcard software. Details about using these features is outside the scope of this chapter.

- *Use this certificate to digitally sign PDF documents*: Click **Select** to open the Select Certificate dialog, where all certificates found in your selected key store are displayed. If the key store is protected by a password, you are prompted for it. When using a smartcard that is protected by a PIN, you are also prompted for that.

Select the certificate to use for digitally signing the exported PDF, then click **Sign**. All other fields on the Digital Signatures tab are accessible only after a certificate has been selected.

- *Certificate password*: Enter the password used for protecting the private key associated with the selected certificate. Usually this is the key store password. If the key store password has already been entered in the Select Certificate dialog, the key store may already be unlocked and not require the password again.

When using a smartcard, enter the PIN here. Some smartcard software will prompt you for the PIN again before signing.

- *Location, Contact information, Reason*: Optionally enter additional information about the digital signature that will be applied to the PDF. This information will be embedded in the appropriate PDF fields and will be visible to anyone viewing the PDF. Any or all of the three fields may be left blank.

Figure 15: Digital Signatures tab of PDF Options dialog

- **Time Stamp Authority:** Optionally select a Time Stamping Authority (TSA) URL. During the PDF signing process, the TSA will be used to obtain a digitally signed timestamp that is then embedded in the signature. Anyone viewing the PDF can use this timestamp to verify when the document was signed.

The list of TSA URLs that can be selected is maintained under **Tools > Options > LibreOffice > Security > TSAs**. If no TSA URL is selected (the default), the signature will not be timestamped, but will use the current time from your local computer.

Exporting to EPUB format

EPUB format has become popular since mobile devices such as smartphones, tablets, and e-readers appeared on the market. The EPUB format is implemented as an archive file consisting of HTML files carrying the content, along with images and other supporting files.

Writer can export a file to EPUB. A text-only document generally exports well, but some contents (such as illustrations, tables, and cross-references) may not export correctly. These functions are expected to be added or greatly improved in later releases of LibreOffice.

Tip

Other ways to export to ePub from Writer (.odt) files include Calibre, an open-source e-book manager that runs on Windows, macOS, and Linux. Calibre provides many e-book conversion facilities and allows editing of the result. <https://calibre-ebook.com/>

Quick export to EPUB

Choose **File > Export As > Export Directly as EPUB** to export the entire document using the EPUB settings you most recently selected on the EPUB Export dialog (see below). You are asked to enter the file name and location for the EPUB file, but you do not get a chance to select other options.

Controlling export to EPUB

For more control over the content and quality of the resulting EPUB file, use **File > Export As > Export as EPUB**. The EPUB Export dialog opens (Figure 16).

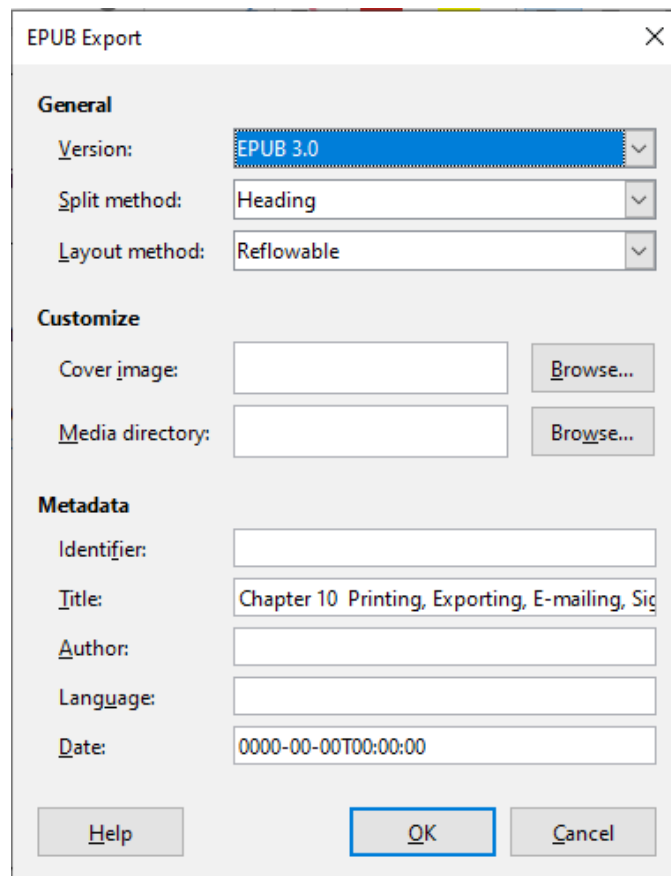

Figure 16: EPUB Export dialog

The EPUB Export dialog has the following fields:

Version

Choose the EPUB version for the exported file. Values are EPUB 2.0 and EPUB 3.0.

Split method

Select the method to start a new section. Choose **Heading** to start the section on a heading, according to the document's chapter numbering. Choose **Page break** to start the section on a page break.

Layout method

Choose **Reflowable** to have the ebook display change to fit the screen size and the user's preference (so page size and header/footer content is not exported). Choose **Fixed** to have the ebook layout remain the same under all conditions.

Customize - Cover image

The path to the image file for the cover page. If no image is specified, the EPUB file will automatically use any image with a name like cover.gif, cover.jpg, cover.png, or cover.svg. A custom cover image is embedded in the EPUB file.

Customize - Media directory

The path to the optional directory for the cover image, metadata, and multimedia files. If you do not specify a directory, the exporter looks for custom media and custom metadata in the current document directory inside a folder with the same name as the document file name.

Metadata

The basic information for the file that provides tags to help searches. These fields provide another chance to edit metadata that is picked up by default from **File > Properties** in Writer.

Exporting to other formats

LibreOffice uses the term “export” for some file operations involving a change of file type. If you cannot find what you want under **File > Save As**, look under **File > Export** as well. Writer can export files to XHTML, ePub and other formats, as shown in Figure 17.

Choose **File > Export**. On the Export dialog, specify a file name for the exported document, then select the required file format and click **Export**.

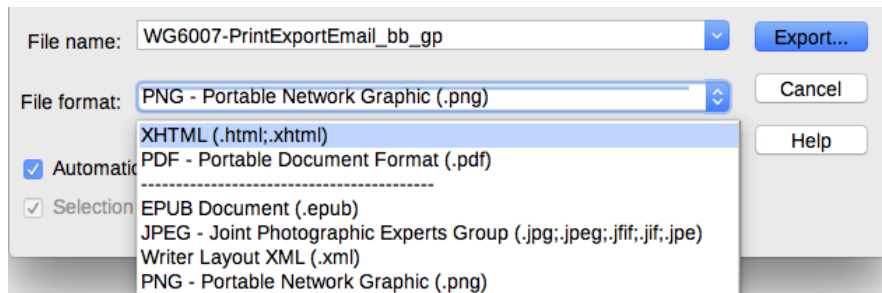

Figure 17: Export file formats

E-mailing Writer documents

LibreOffice provides several ways to quickly and easily send a Writer document as an e-mail attachment in one of three formats: .odt (OpenDocument Text, Writer’s default format), .doc (Microsoft Word format), or .pdf.

To send the current document in .odt format, choose:

- 1) **File > Send > E-mail Document**, or **File > Send > E-mail as OpenDocument Text**. Writer opens your default e-mail program. The document is attached.
- 2) In your e-mail program, enter the recipient, subject, and any text you want to add, then send the e-mail.

If you choose E-mail as Microsoft Word, Writer first creates a file in Word format and then opens your e-mail program with the Word file attached. Similarly, if you choose E-mail as PDF, Writer opens the PDF Options dialog where you can select the settings you want, then creates a PDF, and then opens your email program with the .pdf file attached.

E-mailing a document to several recipients

To e-mail a document to several recipients, you can use the features in your e-mail program or you can use Writer’s mail merge facilities to extract email addresses from an address book.

You can use Writer’s mail merge to send e-mail in two ways:

- Use the Mail Merge Wizard to create the document and send it.
- Create the document in Writer without using the Wizard, then use the Wizard to send it.

See Chapter 14, Mail Merge, for details.

Digital signing of documents

To sign a document digitally, you need a personal key, also known as a certificate. A personal key is stored on your computer as a combination of a private key, which must be kept secret, and a public key, which you add to your documents when you sign them. You can get a certificate from a certification authority, which may be a private company or a governmental institution.

When you apply a digital signature to a document, a checksum is computed from the document's content plus your personal key. The checksum and your public key are stored together with the document.

When someone later opens the document on any computer with a recent version of LibreOffice, the program will compute the checksum again and compare it with the stored checksum. If both are the same, the program will signal that you see the original, unchanged document. In addition, the program can show you the public key information from the certificate. You can compare the public key with the public key that is published on the web site of the certificate authority. Whenever someone changes something in the document, this change breaks the digital signature.

On Windows operating systems, the Windows features of validating a signature are used. On Linux systems, files that are supplied by Thunderbird, Mozilla, or Firefox are used. For a more detailed description of how to get and manage a certificate, and signature validation, see "About Digital Signatures" and "Applying Digital Signatures" in the LibreOffice Help.

To sign a document:

- 1) Choose **File > Digital Signatures > Digital Signatures**.
 - If you have set LibreOffice to warn you when the document contains notes (comments) or recorded changes, you may see a message box asking whether you want to continue signing the document.
 - If you have not saved the document since the last change, a message box appears. Click **Yes** to save the file.
- 2) The Digital Signatures dialog (Figure 18) opens. Click **Sign Document** to add a public key to the document.
- 3) In the Select Certificate dialog, select your certificate and click **OK** to return to the Digital Signatures dialog.
- 4) The certificate used is displayed in the dialog with an icon next to its name. This icon indicates the status of the digital signature.
- 5) Click **Close** to apply the digital signature.

A signed document shows an icon in the status bar. You can double-click the icon to view the certificate. More than one signature can be added to a document.

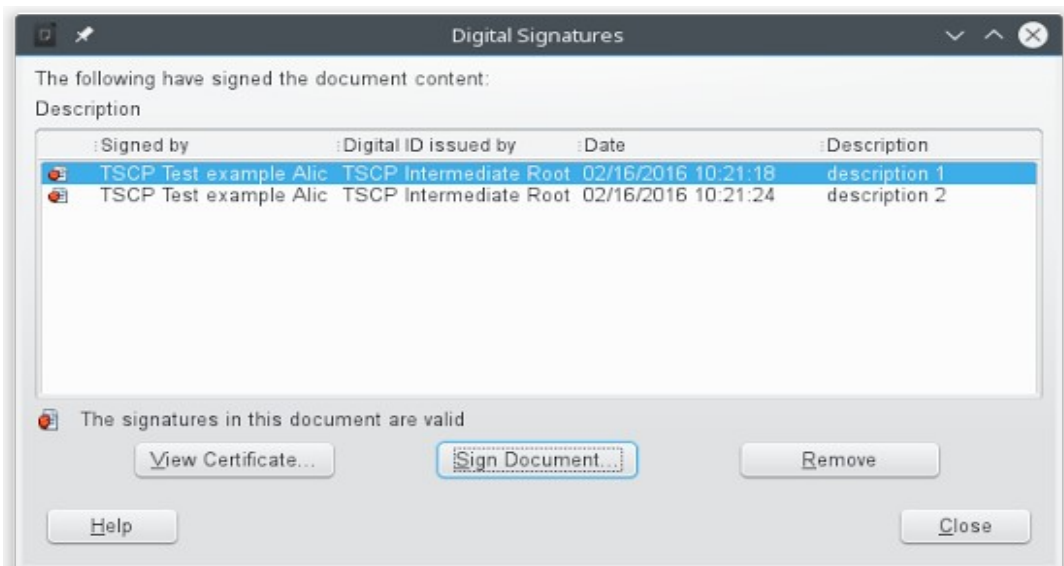

Figure 18: Signatures of the document

Signing multiple times with same signature

LibreOffice provides a field for a signature description, so multiple signatures from the same author are allowed, because each signature can have a different meaning.

When you select **File > Digital Signatures**, the dialog (Figure 18) lists existing signatures together with their description (if they have any).

When you click the **Sign Document** button, the dialog (Figure 19) for certificate selection also asks for an optional description.

Changing an existing description invalidates the signature.

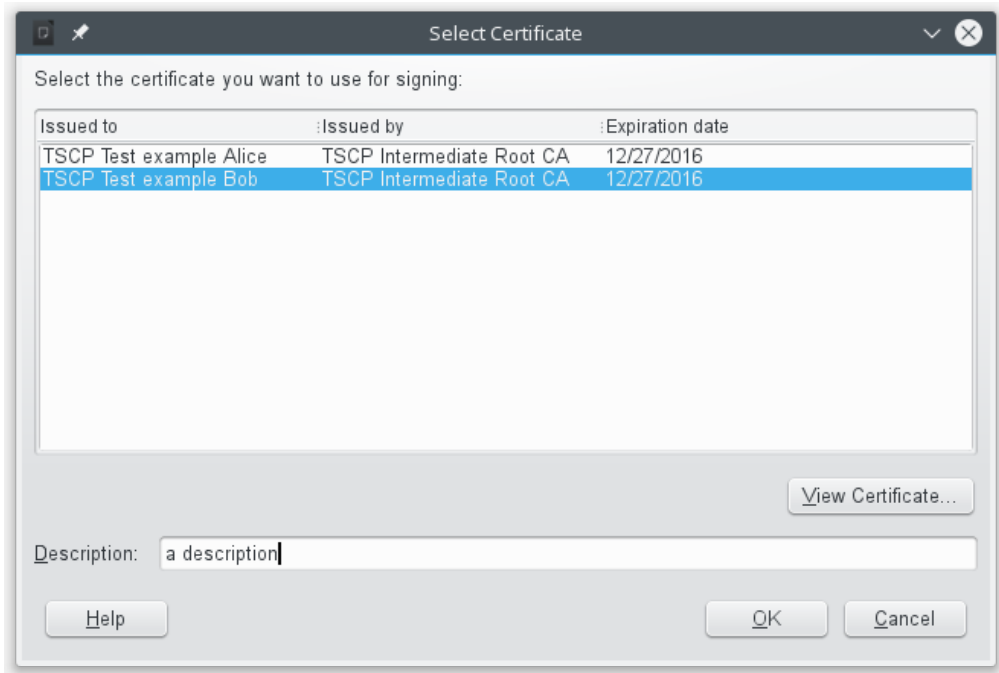

Figure 19: Signatures can have a description

Including a signature line

You can generate a graphic box representing a signature line (Figure 20) using **Insert > Signature Line** (see Figure 21), and you can optionally sign the signature line using a digital certificate.

Removing personal data

You may wish to ensure that personal data, versions, comments, hidden information, or recorded changes are removed from files before you send them to other people or create PDFs from them.

In **Tools > Options > LibreOffice > Security > Options**, you can set LibreOffice to warn you automatically when saving files containing certain information and optionally remove personal information.

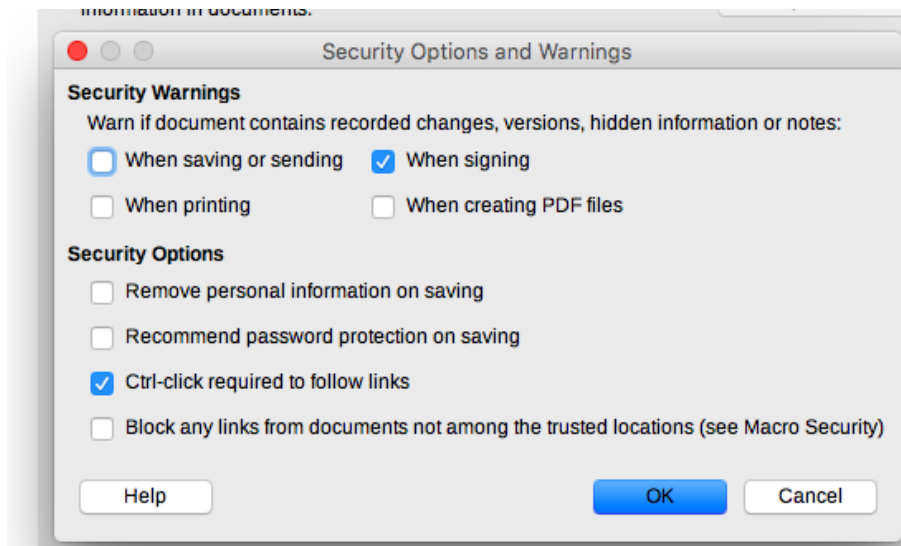

Figure 22: Set security warnings and options

To remove personal and some other data from a file, go to **File > Properties**. On the General tab, uncheck **Apply user data** and click the **Reset Properties** button. This removes any names in the created and modified fields, deletes the modification and printing dates, and resets the editing time to zero, the creation date to the current date and time, and the version number to 1.

To remove version information, either (a) go to **File > Versions**, select the versions from the list and click **Delete**, or (b) use **Save As** and save the file with a different name.

Redaction

You can redact documents to remove or hide sensitive information or to allow the selective disclosure of information. For example, when a document is subpoenaed in a court case, information not specifically relevant to the case at hand is often redacted.

To redact a document:

- 1) Open the document in LibreOffice.
- 2) Click **Tools > Redact** on the Menu bar, and wait for the document to be prepared for redaction and transferred to Draw. The Redaction toolbar (Figure 23) opens.

Figure 23: Redaction toolbar

- 3) Do the redaction by using the **Rectangle Redaction** and **Freeform Redaction** tools on the Redaction toolbar. The shapes will be transparent and in gray so you can see what you are redacting.
- 4) Optionally use the **Export Directly as PDF** tool to make an in-redaction copy of the document in PDF to use as a verbatim copy for review. The redacted items will be in transparent grey.
- 5) To finalize the redaction, select the desired option (black or white) on the **Redacted Export** tool. The transparent grey shapes are converted to opaque black or white shapes and the document is exported as a pixellized PDF. There will be no selectable text in it, and the redacted content will be non-existent.

Auto-redaction

To partially automate the redaction process, you can define certain words (such as names) to be redacted wherever they are found in the document. To do this, choose **Tools > Auto-Redact** on the Menu bar to open the Automatic Redaction dialog (Figure 24). Here you can load a list of terms (targets), add targets, delete targets, edit targets, and save a list of targets.
