Publication date and software version

Published June 2021. Based on LibreOffice 7.1 Community.
Other versions of LibreOffice may differ in appearance and functionality.

Using LibreOffice on macOS

Some keystrokes and menu items are different on macOS from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this document. For a detailed list, see the application Help.

<i>Windows or Linux</i>	<i>macOS equivalent</i>	<i>Effect</i>
Tools > Options menu selection	LibreOffice > Preferences	Access setup options
Right-click	<i>Control</i> +click or right-click depending on computer setup	Open a context menu
<i>Ctrl</i> (Control)	⌘ (Command)	Used with other keys
<i>F11</i>	⌘+T	Open the Styles deck in the Sidebar

Introduction

Math is a formula editor module included with LibreOffice that allows you to create or edit formulas (equations) in a symbolic form, within LibreOffice documents or as stand-alone objects. Example formulas are shown below:

$$\frac{df(x)}{dx} = \ln(x) + \tan^{-1}(x^2) \quad \text{or} \quad \text{NH}_3 + \text{H}_2\text{O} \rightleftharpoons \text{NH}_4^+ + \text{OH}^-$$

The Formula Editor in Math uses a markup language to represent formulas. This markup language is designed to be easily read wherever possible. For example, `a over b` using markup language produces the fraction $\frac{a}{b}$ when used in a formula.

Getting started

Using the Formula Editor, you can create a formula as a separate document or file for a formula library, or insert formulas directly into a document using LibreOffice Writer, Calc, Impress, or Draw.

Formulas as separate documents or files

To create a formula as a separate document or file, use one of the following methods to open an empty formula document in LibreOffice Math (Figure 1):

- On the Menu bar, go to **File > New > Formula**.
- On the Standard toolbar, click the triangle to the right of the **New** icon and select **Formula**.
- In the Start Center, click **Math Formula**.
- From within LibreOffice Math, use the keyboard shortcut `Ctrl+N`.
- You can also launch Math from the command line using `libreoffice --math`

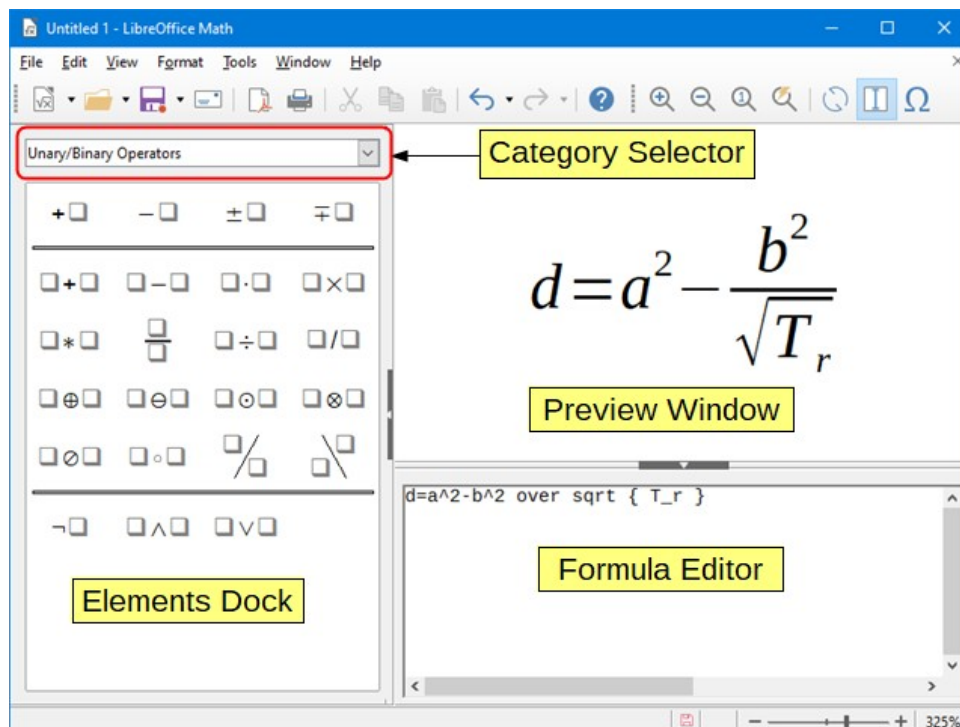

Figure 1: An empty formula document in Math

As you enter the markup language in the Formula Editor, the formula will appear in the Preview window during and after input of the markup language. The Elements Dock to the left of the Preview window may also appear, if these have been selected in **View** on the Menu bar. Figure 2 illustrates how to enable the Elements dock in Math. For more information on creating formulas, see “Creating formulas” on page 7.

Figure 2: Enabling the Elements Dock

Formulas in LibreOffice documents

To insert a formula into a LibreOffice document, open the document in Writer, Calc, Draw, or Impress. The LibreOffice module you are using affects how you position the cursor to insert the formula.

- In Writer, click in the paragraph where you want to insert the formula.
- In Calc, click in the spreadsheet cell where you want to insert the formula.
- In Draw and Impress, the formula is inserted into the center of the drawing or slide.

Then, go to **Insert > Object > Formula** on the Menu bar to open the Formula Editor. Alternatively, go to **Insert > Object > OLE Object** on the Menu bar to open the Insert OLE Object dialog, then select **Create new** option, choose the **Object Type** “LibreOffice Formula” and then click **OK** to open the Formula Editor. The Elements Dock to the left of the Preview window and/or the Elements dialog as a floating dialog may also appear, if these have been selected in **View** on the Menu bar.

Figure 3 shows an example Writer document with the formula box selected ready for a formula to be entered.

When you have completed entering the markup language for your formula, close the Formula Editor by pressing the *Esc* key or by clicking an area outside the formula in your document. Double-clicking on the formula object in the document will open the Formula Editor again so that you can edit the formula.

Formulas are inserted as OLE objects into documents. You can change how the object is placed within the document, as with any OLE object. For more information on OLE objects, see “Formulas in Writer” on page 26, “Formulas in Calc, Draw, and Impress” on page 31, and the user guides for Writer, Calc, Draw, and Impress.

Figure 3: Empty formula in a Writer document

If you frequently insert formulas into documents, it is recommended to add the Formula button to the Standard toolbar or create a keyboard shortcut. See “Customization” on page 33 for more information.

Creating formulas

You can insert a formula using one of the following methods:

- In the Elements dock, select a category in the drop-down list, then a symbol.
- Right-click in the Formula Editor and select a category, then a symbol in the context menu.
- Enter markup language directly in the Formula Editor.

✓ Note

Using the Elements dock or the context menus to insert a formula provides a convenient way to learn the markup language used by Math.

i Tip

When using the Elements dock, it is recommended to have *Extended tips* selected in the LibreOffice Options. This will help you identify the categories and symbols you want to use in the formula. Go to **Tools > Options > LibreOffice > General** and select **Extended tips** in the *Help* section.

Elements dock

The Elements dock can be used when entering formula data.

- 1) Go to **View > Elements** on the Menu bar to open the Elements dock (Figure 4).
- 2) Select the category you want to use in your formula in the drop-down list at the top of the Elements Dock.
- 3) Select the symbol you want to use in the formula in the Elements Dock. The symbols that are available change according to the selected category.
- 4) After choosing one of the symbols in the Elements Dock, the Formula Editor will be updated with the Markup notation of the selected symbol.

Figure 4: Elements dock

✓ Note

The Elements dock can either be a floating dialog, as shown in Figure 4, or positioned to the left of the Formula Editor, as shown in Figure 1 and Figure 3.

i Tip

The Elements Dock also provides an Examples category which provides example formulas to use as a starting point for your formula or equation.

Context menu

The Formula Editor also provides a context menu to access categories and symbols when creating a formula. Right-click in the Formula Editor to open the context menu. Select a category and then select the markup example that you want to use in the sub-context menu. An example is shown in Figure 5.

✓ Note

The Elements Dock and the context menu contain only the most common commands that are used in formulas. To insert other symbols and commands not listed in the Elements Dock and context menu, you have to enter them manually using the markup language. For a complete list of commands and symbols available in Math, see Appendix A, Commands Reference, in the *Math Guide*.

Figure 5: Context menu in Formula Editor

Markup language

Markup language is entered directly into the Formula Editor. For example, typing the markup language `5 times 4` into the Formula Editor creates the simple formula 5×4 . If you are experienced in using markup language, it can be the quickest way to enter a formula. Table 1 shows some examples of using markup language to enter commands. For a full list of commands that can be used in the Formula Editor, see Appendix A, Commands Reference, in the *Math Guide*.

Table 1: Example commands using markup language

Display	Command	Display	Command
$a=b$	<code>a = b</code>	\sqrt{a}	<code>sqrt {a}</code>
a^2	<code>a^2</code>	a_n	<code>a_n</code>
$\int f(x)dx$	<code>int f(x) dx</code>	$\sum a_n$	<code>sum a_n</code>
$a \leq b$	<code>a <= b</code>	∞	<code>infinity</code>
$a \times b$	<code>a times b</code>	$x \cdot y$	<code>x cdot y</code>

Greek characters

Using markup language

Greek characters are commonly used in formulas, but they cannot be entered into a formula using the Elements dock or the context menu. Use the English names of Greek characters in markup language when entering Greek characters into a formula. See Appendix A, Commands Reference, in the *Math Guide* for a list of characters that can be entered using markup language.

- For a lowercase Greek character, type a percentage % sign, then type the character name in lowercase using the English name. For example, typing %lambda creates the Greek character λ .
- For an UPPERCASE Greek character, type a percentage % sign, then type the character name in UPPERCASE using the English name. For example, typing %LAMBDA creates the Greek character Λ .
- For an *italic* Greek character, type a percentage % sign followed by the i character, then the English name of the Greek character in lower or UPPER case. For example, typing %iTHETA creates the *italic* Greek character Θ .

Symbols dialog

Greek characters can also be entered into a formula using the Symbols dialog.

- 1) Make sure your cursor is in the correct position in the Formula Editor.
- 2) Go to **Tools > Symbols** on the Menu bar, or click the **Symbols** icon in the Tools toolbar, to open the Symbols dialog (Figure 6).
- 3) Select *Greek* in the *Symbol set* drop-down list. For *italic* characters, select *iGreek* in the drop-down list.
- 4) Double-click the Greek character you want to insert or select it and click **Insert**. When selected, the name of the character is shown below the symbol list.
- 5) Click **Close** when you have finished entering Greek characters into your formula.

Figure 6: Symbols dialog

Formula examples

Example 1

The simple formula 5×4 can be created using LibreOffice Math as follows:

- 1) Make sure your cursor is flashing in the Formula Editor, then select the category **Unary/Binary Operators** and symbol **Multiplication** using one of the following methods:
 - In the Elements Dock, select **Unary/Binary Operators** in the drop-down list and then select the **Multiplication** icon $\square \times \square$.
 - Right-click in the Formula Editor and select **Unary/Binary Operators > a times b** in the context menu.
 - Using markup language, enter `5 times 4` in the Formula Editor.
 - The first two methods place the formula text `<?> times <?>` in the Formula Editor and the symbol $\square \times \square$ appears in the document. For the third method, using markup language in the Formula Editor places the formula 5×4 directly into the document and there is no need to carry out the following steps.
- 2) Select the first placeholder `<?>` before the word `times` in the Formula Editor and replace it with the character 5. The formula in the document updates automatically.
- 3) Select the second placeholder `<?>` after the word `times` in the Formula Editor and replace it with the character 4. The formula in the document updates automatically.

Tip

To move forward from one placeholder to the next placeholder in a formula, press the *F4* key. To move backward from one placeholder to the previous placeholder in a formula, use the key combination *Shift+F4*.

Note

If necessary, you can prevent a formula in a document from updating automatically. Go to **View** on the Menu bar and deselect **AutoUpdate display**. To then manually update a formula, press the *F9* key or select **View > Update** on the Menu bar.

Example 2

You want to enter the formula $\pi \approx 3.14159$ where the value of pi is rounded to 5 decimal places. You know the name of the Greek character (π), but do not know the markup associated with the **Is Similar Or Equal** symbol \approx .

- 1) Make sure your cursor is flashing in the Formula Editor.
- 2) Enter `%pi` in the Formula Editor to enter the Greek character for pi (π).
- 3) Select the category **Relations** and symbol **Is Similar Or Equal** using one of the following methods:
 - In the Elements dock, select **Relations** in the drop-down list and then select the **Is Similar Or Equal** icon $\square \approx \square$.
 - Right-click in the Formula Editor and select **Relations > a simeq b** in the context menu.
- 4) Delete the first placeholder `<?>` before the word `simeq` in the Formula Editor.
- 5) Select the second placeholder `<?>` after the word `simeq` in the Formula Editor and replace it with the characters `3.14159`. The formula $\pi \approx 3.14159$ now appears in the document.

Editing formulas

How you edit a formula and switch into formula editing mode depends on whether the formula is in Math or another LibreOffice component.

- 1) In Math, double-click on a formula element in the formula that appears in the Preview window to select the formula element in the Formula Editor, or directly select a formula element in the Formula Editor.
- 2) In Writer, Calc, Impress, or Draw, double-click on the formula, or right-click on the formula and select **Edit** in the context menu, to open the Formula Editor and enter editing mode. The cursor is positioned at the start of the formula in the Formula Editor.

Note

If you cannot select a formula element using the cursor, click on the **Formula Cursor** icon in the Tools toolbar to activate the formula cursor.

- 3) Select the formula element you want to change using one of the following methods:
 - Click on the formula element in the Preview window, positioning the cursor at the beginning of the formula element in the Formula Editor, then select the formula element in the Formula Editor.
 - Double-click on the formula element in the Preview window to select the formula element in the Formula Editor.
 - Position the cursor in the Formula Editor at the formula element you want to edit, then select that formula element.
 - Double-click directly on the formula element in the Formula Editor to select it.
- 4) Make your changes to the formula element you have selected.
- 5) Go to **View > Update** on the Menu bar, or press the *F9* key, or click on the **Update** icon on the Tools toolbar to update the formula in the Preview window or your document.
- 6) In Math, save your changes to the formula after editing.
- 7) In Writer, Calc, Impress, or Draw, click anywhere in the document away from the formula to leave editing mode, then save the document to save your changes to the formula.

Formula layout

This section provides some advice on how to lay out complex formulas in Math or in your LibreOffice document.

Using braces

LibreOffice Math knows nothing about order of operations within a formula. You need to use braces (curly brackets) to define the order of operations. The following examples show how braces can be used in a formula.

Example 1

2 over x + 1 gives the result $\frac{2}{x}+1$

Math has recognized that the 2 before and the x after the **over** command as belonging to the fraction, and has represented them accordingly. If you want $x+1$ rather than x to be the denominator, you must bracket them together using braces so that both will be placed there.

Inserting braces into `2 over {x + 1}` gives the result $\frac{2}{x+1}$ where $x+1$ is now the denominator.

Example 2

`- 1 over 2` gives the result $-\frac{1}{2}$

Math has recognized the minus sign as a prefix for the 1 and has therefore placed it in the numerator of the fraction. If you wish to show that the whole fraction is negative, with the minus sign in front of the fraction, you must put the fraction in braces to signify to Math that the characters belong together.

Adding braces into the markup language `- {1 over 2}` gives the result $-\frac{1}{2}$ and the whole fraction is now negative.

Example 3

When braces are used in markup language, they are used to define the layout of the formula and are not displayed or printed. If you want to use braces within a formula, use the commands `lbrace` and `rbrace` within the markup language.

`x over {-x + 1}` gives the result $\frac{x}{-x+1}$

Replace the braces using the commands `lbrace` and `rbrace` in the markup language.

Write `x over lbrace -x + 1 rbrace` and the result is $\frac{x}{-x+1}$

Brackets (parentheses) and matrices

If you want to use a matrix in a formula, you have to use the `matrix` command. Below is a simple example of a 2 x 2 matrix.

`matrix { a # b ## c # d }` \Rightarrow $\begin{matrix} a & b \\ c & d \end{matrix}$

In matrices, rows are separated by two hashes (`##`) and entries within each row are separated by one hash (`#`).

Normally, when you use brackets within a matrix, the brackets do not scale as the matrix increases in size. The example below shows a formula where the parentheses do not scale to the size of the resulting matrix.

`(matrix { a # b ## c # d })` \Rightarrow $\left(\begin{matrix} a & b \\ c & d \end{matrix} \right)$

To overcome this problem of brackets in a matrix, LibreOffice Math provides scalable brackets that grow in size to match the size of the matrix. The commands `left(` and `right)` have to be used to create scalable brackets around a matrix. The following example shows how to create a matrix with scalable parentheses.

`left(matrix { a # b ## c # d } right)` \Rightarrow $\left(\begin{matrix} a & b \\ c & d \end{matrix} \right)$

Scalable brackets can also be used with any element of a formula, such as fraction, square root, and so on.

If you want to create a matrix where some values are empty, you can use the grave accent (`) so that Math will put a small space in that position, as shown in the example below:

`left(matrix { 1 # 2 # 3 ##
4 # ` # 6 } right)` \Rightarrow $\begin{pmatrix} 1 & 2 & 3 \\ 4 & & 6 \end{pmatrix}$

Tip

Use the commands `left[` and `right]` to obtain square brackets. A list of all brackets available within Math can be found in Appendix A, Commands Reference, of the *Math Guide*.

Tip

If you want all brackets to be scalable, go to **Format > Spacing** on the Menu bar to open the Spacing dialog. Click on **Category**, select *Brackets* in the drop-down list, and then select the option **Scale all brackets**.

Unpaired brackets

When using brackets in a formula, Math expects that for every opening bracket there will be a closing one. If you forget to add a closing bracket, Math places an inverted question mark next to where the closing bracket should have been placed. For example, `lbrace a; b` will result in $\{ a; b$ because the right bracket `rbrace` is missing.

This inverted question mark disappears when all the brackets are paired. The previous example could be fixed to `lbrace a; b rbrace`, resulting in $\{ a; b \}$. However, there are cases where an unpaired bracket is necessary and for that you have the following options.

Non scalable brackets

A backslash `\` is placed before a non scalable bracket to indicate that the subsequent character should not be regarded as a bracket, but rather as a literal character.

For example, the unpaired brackets in the formula `[a; b [` would result in an inverted question mark because Math expects that `[` will be closed by `]`. To fix the error, you can use the backslash and insert `\ [a; b \ [` into the Formula Editor to obtain $[a; b [$ as the result.

Scalable brackets

To create unpaired scalable brackets or braces in a formula, the markup commands `left`, `right`, and `none` can be used.

Example

The following formula uses the `stack` command to create a two-line formula and adds a bracket only to the right side of the stack.

`abs x = left lbrace stack {x "for" x
>= 0 # -x "for" x < 0} right none` \Rightarrow $|x| = \begin{cases} x & \text{for } x \geq 0 \\ -x & \text{for } x < 0 \end{cases}$

This effect can be achieved by using the `left lbrace` command combined with the `right none` command. The first command indicates that the left bracket is a `lbrace` whereas the second command tells Math that the right bracket will be `none`, meaning that no bracket will be added to the right side of the formula.

Recognizing functions

In the basic installation of Math, Math outputs functions in normal characters and variables in italic characters. However, if Math fails to recognize a function, you can tell Math that you have just entered a function. Enter the markup command `func` before a function forces Math to recognize the following text as a function and uses normal characters.

For a full list of functions within Math, see Appendix A, Commands Reference, in the *Math Guide*.

Some Math functions have to be followed by a number or a variable. If these are missing, Math places an inverted question mark where the missing number or variable should be. To remove the inverted question mark and correct the formula, you have to enter a number, a variable, or a pair of empty brackets as a placeholder.

Tip

You can navigate through errors in a formula using the *F3* key to move to the next error or the key combination *Shift+F3* to move to the previous error.

Formulas over multiple lines

Suppose you want to create a formula that requires more than one line, for example
$$\begin{matrix} x=3 \\ y=1 \end{matrix}$$
.

Your first reaction would be to press the *Enter* key. However, if you do that, the markup language in the Formula Editor goes to a new line, but the resulting formula does not have two lines. To add a new line to the formula you need to use the markup command `newline`.

Example

The examples below illustrate how the markup command `newline` can be used to add a new line to a formula. The first one simply adds an *Enter* to break the line in the markup language, which does not result in adding a new line. The second example uses the `newline` command, yielding a two-line formula.

Markup Language	Resulting Formula
<code>x = 3 y = 1</code>	$x=3y=1$
<code>x = 3 newline y = 1</code>	$\begin{matrix} x=3 \\ y=1 \end{matrix}$

It is not possible in Math to create multiple line formulas when a line ends with an equals sign and you want to continue the formula on a new line without completing the term on the right side of the equals sign. If you require a multiple line formula to have an equals sign at the end of a line without a term after the equals sign, then use either empty quotes "" or empty braces {} or the space characters grave ` or tilde ~.

By default, a multiple line formula is center aligned. For more information on alignment using the equals sign, see "Customization" on page 33.

Spacing within formulas

Spacing between the elements in a formula is not set by using space characters in the markup language. If you want to add spaces into your formula, use one of the following options:

- Grave ` to add a small space.
- Tilde ~ for a large space.
- Add space characters between quotes ". These spaces will be considered as text.

Any spaces at the end of a line in the markup language are ignored by default. For more information, see “Customization” on page 33.

Adding limits to sum/integral commands

The `sum` and `int` commands, used for summations and integrals respectively, can take the parameters `from` and `to` if you want to set the lower and upper limits. The parameters `from` and `to` can be used singly or together as shown by the following examples. For more information on the sum and integral commands, see Appendix A, Commands Reference, in the *Math Guide*.

Examples

Next you’ll find some examples of how to add upper and lower bounds to summations and integrals. Note that you can use brackets to explicitly define which parts of the formula correspond to the desired bounds.

Markup Language	Resulting Formula
<code>sum from k = 1 to n a_k</code>	$\sum_{k=1}^n a_k$
<code>sum to infinity 2^{-n}</code>	$\sum_{n=1}^{\infty} 2^{-n}$
<code>sum from{ i=1 } to{ n } sum from{ j=1; i <> j } to{ m } x_ij</code>	$\sum_{i=1}^n \sum_{j=1; i \neq j}^m x_{ij}$
<code>int from 0 to x f(t) dt</code>	$\int_0^x f(t) dt$
<code>int_0^x f(t) dt</code>	$\int_0^x f(t) dt$
<code>int from Re f</code>	$\int_{\mathbb{R}} f$

Writing derivatives

When writing derivatives, you have to tell Math that it is a fraction by using the `over` command. The `over` command is combined with the character `d` for a total derivative or the `partial` command for a partial derivative to achieve the effect of a derivative. Braces `{ }` are used in each side of the elements to surround them and make the derivative, as shown by the following examples.

Examples

Below are a few examples of how you can use Math to write derivatives.

Markup Language	Resulting Formula
<code>{df} over {dx}</code>	$\frac{df}{dx}$
<code>{partial f} over {partial y}</code>	$\frac{\partial f}{\partial y}$
<code>{partial^2 f} over {partial t^2}</code>	$\frac{\partial^2 f}{\partial t^2}$

✓ Note

To write function names with primes, as is normal in school notation, you must first add the symbols to the catalog. See “Customization” on page 33 for more information.

Markup language characters as normal characters

Characters that are used as controls in markup language cannot be entered directly as normal characters. These characters are: %, {, }, &, |, _, ^ and ". For example, you cannot write $2\% = 0.02$ in markup language and expect the same characters to appear in your formula. To overcome this limitation in markup language, use one of the following methods:

- Use double quotes to mark that character as text, for example $2\% = 0.02$ will appear in your formula as $2\% = 0.02$. However, this method cannot be used for the double-quote character itself, see “Text in formulas” below.
- Add the character to the Math Catalog, for example the double quote character.
- Use commands, for example `\lbrace` and `\rbrace` give you literal braces $\{ \}$.

✓ Note

The Special Characters dialog used by other LibreOffice modules is not available in Math. If you are going to regularly require special characters in Math, then it is recommended to add the characters to the Math Catalog; see “Customization” on page 33 for more information.

Text in formulas

To include text in a formula, you have to enclose any text in double-quotes, for example x " for $x \geq 0$ in markup language will create the formula x for $x \geq 0$. All characters, except double quotes, can be used in text.

However, if you require double quotes in formula text, then you have to create the text with double quotes in LibreOffice Writer, then copy and paste the text into the Formula Editor, as shown in Figure 7.

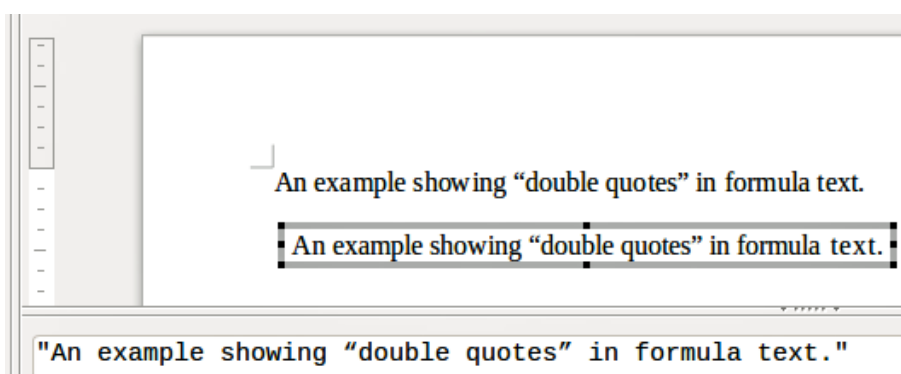

Figure 7: Example of double quotes in formula text

The font used for text in a formula will be the default font that has been set in the Fonts dialog. For more information on how to change fonts used for in formulas, see “Changing formula appearance” on page 18.

By default, text alignment is left-justified in formulas. For more information on how to change text alignment, see “Adjusting formula alignment” on page 23.

Formatting text in formulas

Formatting commands are not interpreted within text used in formulas. If you want to use formatting commands within formula text, then you must break up the text using double quotes in the Formula Editor.

Example

Enter the following in the Formula Editor:

```
"In " color blue bold "isosceles" "triangles, the base angles are equal"
```

creates the following text in a formula In **isosceles** triangles, the base angles are equal .

This example shows how to use the markup commands `color` and `bold` to format the word “isosceles”. Note that the commands are applied to the immediately subsequent text within double quotes. Hence, the formatting commands do not apply to the remainder of the text in the example because it is in a separate quote block.

Aligning formulas using equals sign

LibreOffice Math does not have a command for aligning formulas on a particular character. However, you can use a matrix to align formulas on a character and this character is normally the equals sign (=). In addition, you can use the markup commands `alignr`, `alignl` and `alignc` to set the alignment of each value inside the matrix to the right, left or center, respectively.

Example

Below is an example that uses a matrix to align formulas on the equals sign. Notice how the alignment commands align the contents of each position in the matrix.

```
matrix{ alignr x+y # {}={ } # alignl 2  
## alignr x # {}={ } # alignl 2-y }
```

$$\begin{array}{rcl} x+y & = & 2 \\ x & = & 2-y \end{array}$$

✓ Note

The empty braces each side of the equals sign are necessary because the equals sign is a binary operator and requires an expression on each side. You can use spaces, or ` or ~ characters each side of the equals sign, but braces are recommended as they are easier to see within the markup language.

You can reduce the spacing on each side of the equals sign if you change the inter-column spacing of the matrix. See “Adjusting formula spacing” on page 21 for more information.

Changing formula appearance

This section describes how to change the font or font size in a selected formula and how to change the default font or font size.

✓ Note

If you have already inserted formulas into your document and you change the **default** font or font size, only formulas inserted after the change in default font or font size will use the new default settings. You have to individually change the font or font size of formulas already inserted if you want these formulas to use the same font or font size as the default settings.

Tip

The extension “Formatting of all Math formulas” allows you to change font name and font size for all or only for selected formulas in a document. You can download it and read the installation and usage instructions here:

<https://extensions.libreoffice.org/extensions/show/formatting-of-all-math-formulas>

Formula font size

Current formula font size

To change the font size used for a formula already inserted in Math or another LibreOffice component:

- 1) Click in the markup language in the Formula Editor.
- 2) Go to **Format > Font size** on the Menu bar to open the Font Sizes dialog (Figure 8).
- 3) Select a different font size using the *Base size* spinner or type a new font size in the *Base Size* box.
- 4) Click **OK** to save your changes and close the dialog. An example result when you change font size is shown below.

Example

Default font size 12pt: $\pi \simeq 3.14159$

After font size change to 18pt: $\pi \simeq 3.14159$

Figure 8: Font Sizes dialog

Default formula font size

To change the default font size used for all formulas in Math or another LibreOffice component:

- 1) Before inserting any formulas in your document, go to **Format > Font size** on the Menu bar to open the Font Sizes dialog (Figure 8).
- 2) Select a different font size using the *Base size* spinner or type a new font size in the *Base size* box.
- 3) Click **Default** and confirm your changes to the base size font. Any formulas created from this point on will use the new base size font for formulas.
- 4) Click **OK** to save your changes and close the Font Sizes dialog.

Font size options

The Font Sizes dialog (Figure 8) specifies the font sizes for a formula. Select a base size and all elements of the formula will be scaled in relation to this base.

- **Base size** – all elements of a formula are proportionally scaled to the base size. To change the base size, select or type in the desired point (pt) size. You can also use other units of measure or other metrics, which are then automatically converted to points. For example, if you enter 1in or 1", Math converts the value to 72 pt.
- **Relative Sizes** – in this section, you can determine the relative sizes for each type of element with reference to the base size.
- **Default** – click this button to save any changes as a default for all new formulas. A confirmation message appears.

Formula fonts

Current formula fonts

To change the fonts used for the current formula in Math or another LibreOffice component:

- 1) Click in the markup language in the Formula Editor.
- 2) Go to **Format > Fonts** on the Menu bar to open the Fonts dialog (Figure 9).

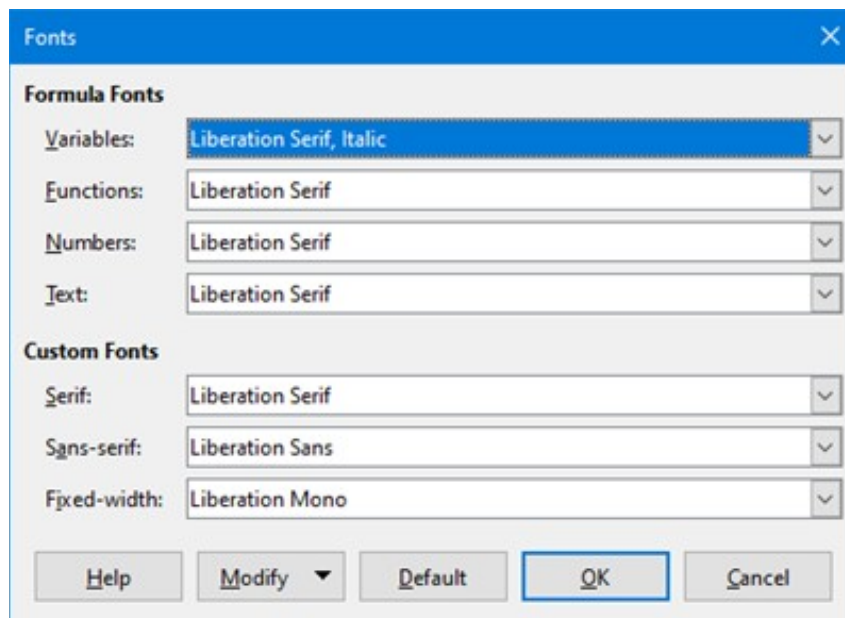

Figure 9: Fonts dialog

- 3) Select a new font for each of the various options in the drop-down lists.
- 4) If the font you want to use does not appear in the drop-down list, click **Modify** and select the option in the context menu to open a fonts dialog. Select the font you want to use and click **OK** to add it to the drop-down list for that option.
- 5) Click **OK** to save your changes and close the Fonts dialog.

Default formula fonts

To change the default fonts used for all formulas in Math or another LibreOffice component:

- 1) Before inserting any formulas in your document, go to **Format > Fonts** on the Menu bar to open the Fonts dialog (Figure 9).
- 2) Select a new font for each of the various options in the drop-down lists.

- 3) If the font you want to use does not appear in the drop-down list, click **Modify** and select the option in the context menu to open a fonts dialog. Select the font you want to use and click **OK** to add it to the drop-down list for that option.
- 4) Click **Default** and confirm your changes to the fonts. Any formulas created from this point on will use the new font for formulas.
- 5) Click **OK** to save your changes and close the Fonts dialog.

Formula font options

Defines the fonts that can be applied to formula elements.

- **Formula Fonts** – defines the fonts used for the variables, functions, numbers and inserted text that form the elements of a formula.
- **Custom Fonts** – in this section of the Fonts dialog (Figure 9), fonts are defined which format other text components in a formula. The three basic fonts Serif, Sans, and Fixed are available. Other fonts can be added to each standard installed basic font using the **Modify** button. Every font installed on a computer system is available for use.
- **Modify** – click one of the options in the drop-down menu to access the Fonts dialog, where the font and attributes can be defined for the respective formula and for custom fonts.
- **Default** – click this button to save any changes as a default for all new formulas. A confirmation message appears.

✓ Note

When a new font is selected for a formula, the old font remains in the list alongside the new one and can be selected again.

✓ Note

Variables should be written in *italics*, so make sure that the *Italic* option is selected. For the font you want to use. For all other elements, use the basic form of a font. The style can be easily altered in the formula itself by using the commands `italic` or `bold` to set these characteristics and `nitalic` or `nbold` to unset them.

Adjusting formula spacing

Use the Spacing dialog (Figure 10) to determine the spacing between formula elements. The spacing is specified as a percentage in relation to the defined base size for font sizes.

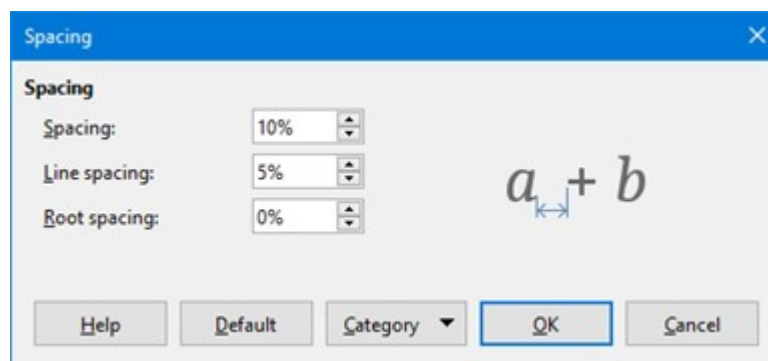

Figure 10: Spacing dialog

Current formula spacing

To change the spacing used for the current formula in Math or another LibreOffice component:

- 1) Click in the markup language in the Formula Editor.
- 2) Go to **Format > Spacing** on the Menu bar to open the Spacing dialog (Figure 10).
- 3) Click **Category** and select one of the options in the drop-down list. The options in the Spacing dialog change according to the category selected.
- 4) Enter new values for the spacing category and click **OK**.
- 5) Check the result in your formula. If not to your satisfaction, repeat the above steps.

Default formula spacing

To change the default spacing used for all formulas in Math or another LibreOffice component:

- 1) Before inserting any formulas in your document, go to **Format > Spacing** on the Menu bar to open the Spacing dialog (Figure 10).
- 2) Click **Category** and select one of the options in the drop-down list. The options in the Spacing dialog change according to the category selected.
- 3) Enter new values for the spacing category.
- 4) Click **Default** and confirm your changes to the formula spacing. Any formulas created from this point on will use the new spacing for formulas.
- 5) Click **OK** to save your changes and close the Spacing dialog.

Note

If you have already inserted formulas into your document and you change the spacing, only formulas inserted after the change in spacing will use the new default settings. You have to individually change the spacing of formulas already inserted if you want these formulas to use the same spacing as the default settings.

Spacing options

Use Category in the Spacing dialog (Figure 10) to determine the formula element for which you would like to specify the spacing. The appearance of the dialog depends on the selected category. A preview window shows you which spacing is modified through the respective boxes.

- **Category** – pressing this button allows you to select the category for which you would like to change the spacing.
- **Spacing** – defines the spacing between variables and operators, between lines, and between root signs and radicals.
- **Indexes** – defines the spacing for superscript and subscript indexes.
- **Fractions** – defines the spacing between the fraction bar and the numerator or denominator.
- **Fraction Bars** – defines the excess length and line weight of the fraction bar.
- **Limits** – defines the spacing between the sum symbol and the limit conditions.
- **Brackets** – defines the spacing between brackets and the content.
 - *Excess size (left/right)* – determines the vertical distance between the upper edge of the contents and the upper end of the brackets.
 - *Spacing* – determines the horizontal distance between the contents and the upper end of the brackets.

- *Scale all brackets* – scales all types of brackets. If you then enter (a over b) in the Formula Editor, the brackets will surround the whole height of the argument. You normally achieve this effect by entering left (a over b right).
- *Excess size* – adjusts the percentage excess size. At 0% the brackets are set so that they surround the argument at the same height. The higher the entered value is, the larger the vertical gap between the contents of the brackets and the external border of the brackets. The field can only be used in combination with *Scale all brackets*.
- **Matrices** – defines the relative spacing for the elements in a matrix.
 - *Line spacing* – determines the spacing between matrix elements in a row.
 - *Column spacing* – determines the spacing between matrix elements in a column.
- **Symbols** – defines the spacing of symbols in relation to variables
 - *Primary height* – defines the height of the symbols in relation to the baseline.
 - *Minimum spacing* – determines the minimum distance between a symbol and variable.
- **Operators** – defines the spacing between operators and variables or numbers.
 - *Excess size* – determines the height from the variable to the operator upper edge.
 - *Spacing* – determines the horizontal distance between operators and variables.
- **Borders** – adds a border to a formula. This option is particularly useful if you want to integrate the formula into a text file in Writer. When making settings, make sure that you do not use 0 as a size as this creates viewing problems for text that surrounds the insertion point.
- **Preview Field** – displays a preview of the current selection.
- **Default** – saves any changes as default settings for all new formulas. A confirmation dialog will appear before saving these changes.

Adjusting formula alignment

The alignment settings determine how formula elements located above one another are aligned horizontally relative to each other.

Note

It is not possible to align formulas on a particular character and formula alignment does not apply to text elements. Text elements are always aligned left.

Note

Independent of using formula alignment given below, it is possible to align formulas using the commands `alignl`, `alignc` and `alignr`. These commands also work for text elements.

Current formula alignment

To change the alignment used for the current formula in Math or another LibreOffice component:

- 1) Click in the markup language in the Formula Editor.
- 2) Go to **Format > Alignment** on the Menu bar to open the Alignment dialog (Figure 11).
- 3) Select either *Left*, *Centered*, or *Right* for horizontal alignment.
- 4) Click **OK** and check the result in your formula. If not to your satisfaction, repeat the above steps.

Figure 11: Alignment dialog

✓ Note

Regardless of the alignment option selected in the Alignment dialog, it is possible to align sections of a formula using the commands `alignl`, `alignc` and `alignr`. For example, they can be useful to align formulas in matrices. These commands also work for text elements.

Default formula alignment

To change the default alignment used for all formulas in Math or another LibreOffice component:

- 1) Before inserting any formulas in your document, go to **Format > Alignment** on the Menu bar to open the Alignment dialog (Figure 11).
- 2) Select either *Left*, *Centered*, or *Right* for horizontal alignment.
- 3) Click **Default** and confirm your changes to the formula alignment. Any formulas created from this point on will use the new alignment for formulas.
- 4) Click **OK** and check the result in your formula. If not to your satisfaction, repeat the above steps.

✓ Note

If you have already inserted formulas into a document and you change the formula alignment, only formulas inserted after the change in alignment will use the new default settings. You have to individually change the alignment of formulas already inserted if you want these formulas to use the same alignment as the default settings.

Changing formula color

Character color

Formula color for the characters used in a formula is changed by using the command `color` in the markup language. This command only works on the formula element immediately after the color name. For example, entering the markup language `color red 5 times 4` gives the result 5×4 . Note that only the number 5 was colored red.

To change the color of the whole formula, you have to enclose the whole formula within brackets. For example, entering the markup language `color red {5 times 4}` gives the result 5×4 .

Math now has full support for named HTML colors. Some of them have been added to the Attributes section of the Elements dock (Figure 4 on page 8). For information on the colors available in Math, see Appendix A, Commands Reference, in the *Math Guide*.

Applying colors using RGB values

Alternatively, it is possible to use custom colors defined using RGB (Red, Green and Blue) values ranging from 0 to 255. This is done by using the `color rgb R G B` markup command, where R, G and B correspond to the Red, Green and Blue values of the desired color.

Example

Below is an example where the term “decision variable” uses the color *sienna*, which is defined by the RGB values 160, 82 and 45.

```
"Let " x_ij " be a " color rgb 160 82 45 "decision variable " "in the problem under consideration"
```

Math will create the following output:

Let x_{ij} be a **decision variable** in the problem under consideration

Background color

It is not possible to select a background color for formulas in LibreOffice Math. The background color for a formula is by default the same color as the document or frame that the formula has been inserted into. In LibreOffice documents, you can use object properties to change the background color for a formula. See “Background and borders” on page 30.

Formula library

If you regularly insert the same formulas into your documents, you can create a formula library using formulas that you have created using the Formula Editor. Individual formulas can be saved as separate files using the ODF format for formulas with the file suffix of `.odf`, or in MathML format with the file suffix of `.mml`.

You can use either LibreOffice Math, Writer, Calc, Draw, or Impress to create formulas and build up your formula library.

Using Math

- 1) Create a folder on your computer to contain your formulas and give the folder a memorable name, for example Formula Library.
- 2) In LibreOffice, go to **File > New > Formula** on the Menu bar, or click on **Math Formula** in the opening splash screen to open Math and create your formula using the Formula Editor. See “Formulas as separate documents or files” on page 5 for more information.
- 3) Go to **File > Save As** on the Menu bar or use the keyboard shortcut `Ctrl+Shift+S` to open a Save As dialog.
- 4) Navigate to the folder you have created for your formula library.
- 5) Type a memorable name for the formula in the *File name* box.
- 6) Select in the *File type* drop-down list either *ODF Formula (.odf)* or *MathML 2.0 (.mml)* as the file type for the formula.
- 7) Click **Save** to save the formula and close the Save As dialog.

Using Writer, Calc, Draw, or Impress

- 1) Create a folder on your computer to contain your formulas and give the folder a memorable name, for example Formula Library.
- 2) Open a document using Writer, Calc, Draw, or Impress.
- 3) Go to **Insert > Object > Formula** on the Menu bar to open the Formula Editor and create your formula. See “Formulas in LibreOffice documents” on page 6 for more information.

- 4) Right-click on the formula object and select **Save Copy as** in the context menu to open a Save As dialog.
- 5) Navigate to the folder you have created for your formula library.
- 6) Type a memorable name for the formula in the *File name* box.
- 7) Select in the File type drop-down list either *ODF Formula (.odf)* or *MathML 2.0 (.mml)* as the file type for the formula.
- 8) Click **Save** to save the formula and close the Save As dialog.

Using your formula library

You cannot insert a formula from your library into a document by dragging and dropping using the mouse, nor by using **Insert > File** on the Menu bar. You must insert the formula as an OLE object.

- 1) Open the document in Writer, Calc, Draw, or Impress.
- 2) Go to **Insert > Object > OLE Object** on the Menu bar to open the Insert OLE Object dialog.
- 3) Select the option **Create from file**.
- 4) Click **Search** to open a file browser dialog.
- 5) Navigate to the folder you have created for your formula library.
- 6) Select the formula you want to insert and click **Open**, or double-click on the formula.
- 7) Click **OK** to insert the formula as an OLE object in the document and close the dialog.

Formulas in Writer

When a formula is inserted into a document, LibreOffice Writer inserts the formula into a frame and treats the formula as an OLE object. Double-clicking on an inserted formula will open the Formula Editor in LibreOffice Math allowing you to edit the formula.

This section explains what options you can change for each individual formula within a Writer document. Please refer to the chapters on styles in the *Writer Guide* for information on how to change the default settings for frame styles for OLE objects.

Automatic formula numbering

Automatic numbering of formulas for cross reference purposes can only be carried out in LibreOffice Writer. The easiest way to add numbered formulas in sequence is to use the AutoText entry **fn** (for '**formula numbered**') using the following steps:

- 1) Start a new line in your document.
- 2) Type *fn* and then press the *F3* key. A two column table with no borders is inserted into your document with the left column containing a sample formula and the right column containing a reference number, as shown below.

$$E = mc^2 \tag{1}$$

- 3) Delete the sample formula and insert your formula as an object in the left column.
- 4) Alternatively, you can first insert your formula into the document, then carry out Steps 1 and 2 above replacing the sample formula with your formula.

Cross referencing

- 1) Click in your document where you want the cross reference to appear.
- 2) Go to **Insert > Cross-reference** on the Menu bar to open the Fields dialog (Figure 12).

- 3) Click on the *Cross-references* tab, then select **Text** in the *Type* section.
- 4) In the *Selection* section, select the formula number you want to refer to.
- 5) In the *Insert reference to* section, select **Reference** and click **Insert**.
- 6) When you have finished creating cross references, click **Close** to close the Fields dialog.

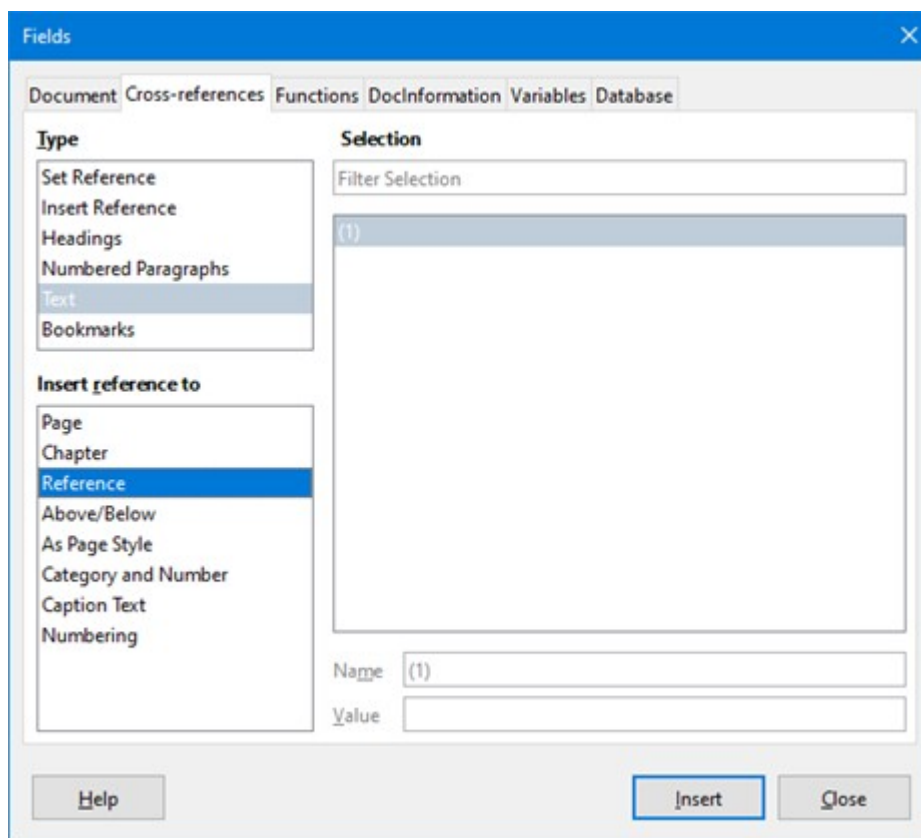

Figure 12: Fields dialog – Cross-references tab

Tip

To insert the cross reference number without parentheses, select *Numbering* instead of *Reference* in the *Insert reference to* section.

Note

If you want to use square parentheses instead of round ones, or if you want the cross reference number to be separated from the formula by tabs instead of using a table, then refer to the chapter on automatic text in the *Writer Guide*.

Anchoring formulas

A formula is treated as an object within Writer and its default anchoring is **To character** within a paragraph when it is inserted into a document. To change the anchoring of a formula object:

- 1) Right-click on the selected formula object and select **Anchor** in the context menu.
- 2) Select a new anchoring option in the context sub-menu. The anchoring positions available are **To Page**, **To Paragraph**, **To Character**, or **As Character**.
- 3) Alternatively, right-click on the selected formula object and select **Properties** in the context menu, or go to **Format > Frame and Object > Properties** on the Menu bar to open the Object dialog (Figure 13).

- 4) Make sure the *Type* tab is selected and select a new anchoring position from the *Anchor* section in the upper right of the tab.
- 5) Click **OK** to save your changes and close the Object dialog.

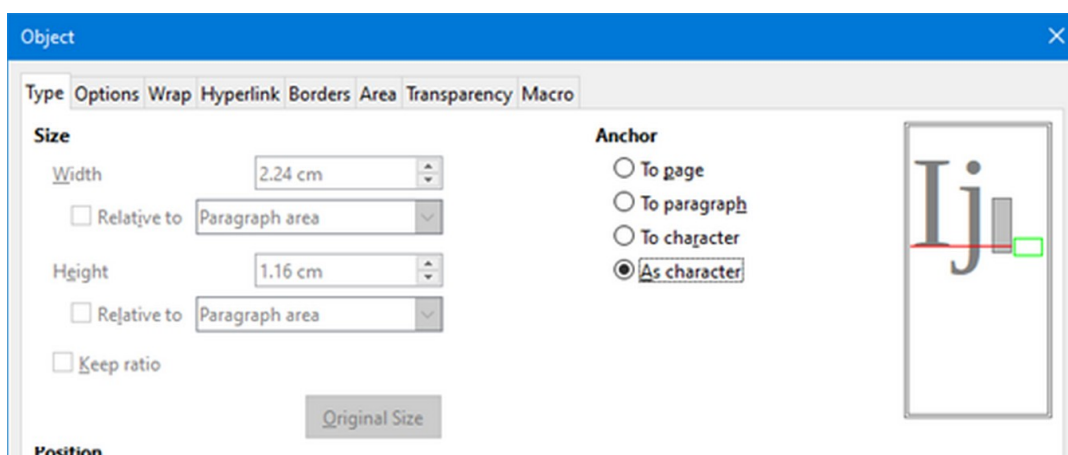

Figure 13: Object dialog – Type tab with Anchor options

✓ Note

The anchoring options are not available in the Object dialog when you are making changes to the options available for frame styles. For more information on how to modify frame styles, please refer to the chapters on styles in the *Writer Guide*.

Vertical alignment

The normal default setting for vertical alignment for formula objects is to use the text base line as a reference. This default setting can be changed by modifying the Formula frame style; see the chapters on styles in the *Writer Guide* for more information.

To change the vertical alignment position of an individual formula object (assuming that the **As character** anchoring option is selected):

- 1) Right-click on the selected formula object and select **Properties** in the context menu, or go to **Format > Frame and Object > Properties** to open the Object dialog (Figure 13).
- 2) Make sure the *Type* tab is selected and select a new alignment position in the drop-down list in the *Position* section. The vertical alignment options available are **Top**, **Bottom**, **Center**, or **From bottom**.
- 3) If necessary, type in the text box a plus or minus value for vertical alignment. This option is only available if **From bottom** vertical alignment has been selected.
- 4) Select the type of text alignment in the drop-down list in the *Position* section. The text alignment options available are **Base line**, **Character**, and **Row**.
- 5) Click **OK** to save your changes and close the Object dialog.

✓ Note

If the **Position** section in the Object dialog is grayed out and not available, then go to **Tools > Options > LibreOffice Writer > Formatting Aids** and uncheck the option **Math baseline alignment**. This setting is stored with the document and applies to all formulas within it. Any new documents created will also use this setting for **Math baseline alignment**.

Object spacing

A formula object, when inserted into a Writer document, has spacing each side of the formula object. The default value used for spacing is set within the frame style for formula objects and can be changed by modifying the Formula frame style, see the chapters on styles in the *Writer Guide* for more information.

You can individually adjust the spacing for each formula object within your document as follows:

- 1) Create your formula in your Writer document.
- 2) Right-click on your selected formula object and select **Properties** in the context menu, or go to **Format > Frame and Object > Properties** on the Menu bar to open the Object dialog.
- 3) Click on the **Wrap** tab to open the Wrap page in the Object dialog (Figure 14).
- 4) In the **Spacing** section, enter the spacing value for *Left*, *Right*, *Top* and *Bottom* spacing.
- 5) Click **OK** to save your changes and close the Object dialog.

Figure 14: Object dialog – Wrap tab

Text mode

In large formulas placed within a line of text, the formula elements can often be higher than the text height. Therefore, to make large formulas easier to read, it is recommended to always insert large formulas into a separate paragraph of their own so that it is separated from text.

However, if it is necessary to place a large formula within a line of text, double-click on the formula to open the Formula Editor and then go to **Format > Text Mode** on the Menu bar. The Formula Editor will try to shrink the formula to fit the text height. The numerators and denominators of fractions are shrunk, and the limits of integrals and sums are placed beside the integral/sum sign, as shown in the following example.

Example

A formula in a separate paragraph:

$$\sum_{i=2}^5 i^2$$

and the same formula embedded into a line of text using text mode format: $\sum_{i=2}^5 i^2$

Background and borders

The default setting for background (area fill) and borders for formula objects is set by the formula frame style. To change this default setting for formula frame style, refer to the chapters on styles in the *Writer Guide*. However, for individual formulas in your document, you can change the background and borders.

✓ Note

The size of the frame that a formula is placed in when inserted into a document cannot be changed. The frame size for a formula object depends on the setting of the formula font size, see “Formula font size” on page 19 for more information.

Backgrounds

- 1) In your document, select the formula where you want to change the background.
- 2) Right-click on the formula and select **Properties** in the context menu, or go to **Format > Frame and Object > Properties** on the Menu bar to open the Object dialog.
- 3) Click on the **Area** tab and use the buttons to select the type of fill you want to use for your formula (Figure 15).
- 4) Select the options you want to use for your formula background. The options change depending on the type of fill selected.
- 5) Click **OK** to save your changes and close the Object dialog.

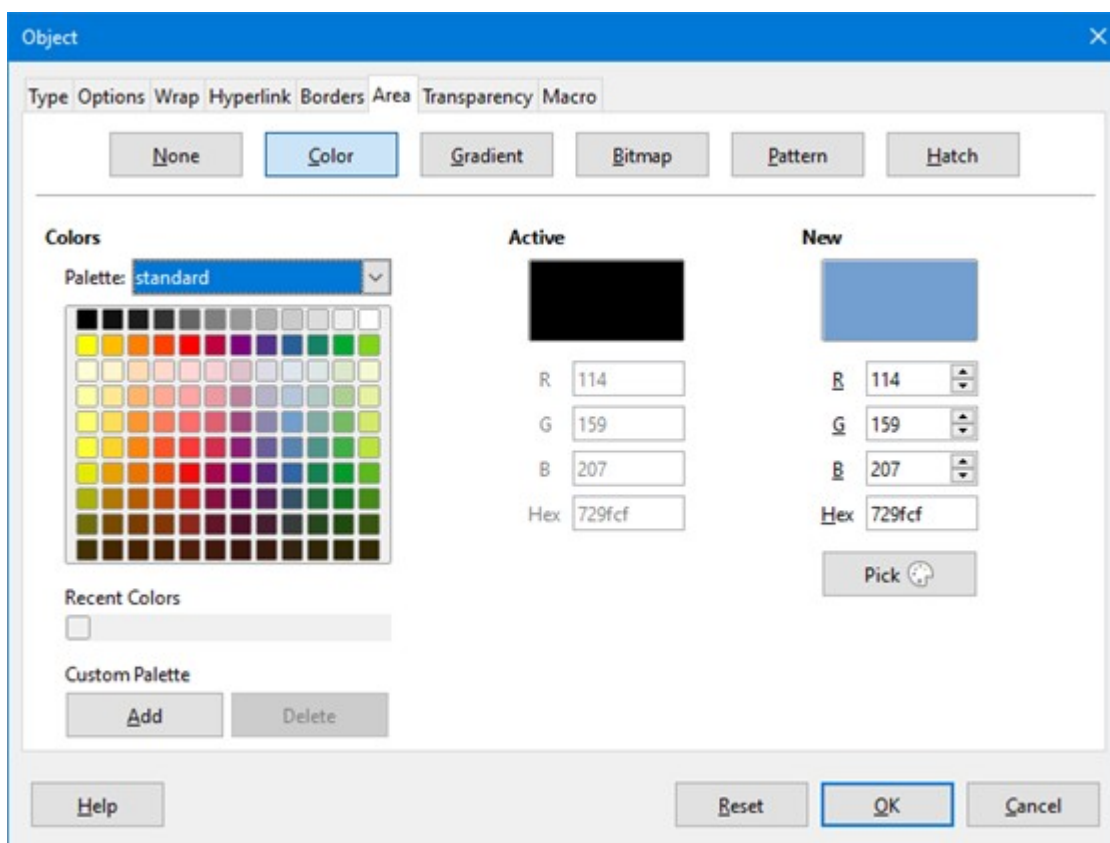

Figure 15: Object dialog – Area tab

Borders

- 1) In your document, select the formula where you want to change the borders.
- 2) Right-click on the formula and select **Properties** in the context menu, or go to **Format > Frame and Object > Properties** on the Menu bar to open the Object dialog.

- 3) Click on the **Borders** tab and select the options you want to use for your formula borders (Figure 16).
- 4) Click **OK** to save your changes and close the Object dialog.

Figure 16: Object dialog – Borders tab

Quick insertion of formulas

If you know the markup language for your formula, you can quickly insert it into your Writer document without opening the Formula Editor as follows:

- 1) Enter the formula markup language into your document at the position where you want the formula to be placed.
- 2) Select the markup language.
- 3) Go to **Insert > Object** on the Menu bar and select **Formula** to create a formula from the selected markup language.
- 4) Alternatively you can use the key combination *Ctrl + Insert* to open the “Insert OLE Object” dialog and then select **Formula**.

Formulas in Calc, Draw, and Impress

In Calc, Draw, and Impress, formulas are inserted as OLE objects without any background (area fill) or borders. Each formula object is inserted into a spreadsheet, drawing, or slide as follows:

- In Calc, formulas are inserted into a selected cell in a spreadsheet with no style assigned to the formula object.
- In Draw and Impress, formulas are inserted into a central position on your drawing or slide and, by default, are assigned the drawing object style *Object with no fill and no line*. For more information on how to modify or assign drawing object styles, see the *Draw Guide* or the *Impress Guide*.

Anchoring formulas

Calc

A formula object can be anchored into a spreadsheet as **To Page** (default setting), or as **To Cell**. To change the anchoring type of formulas in a Calc spreadsheet:

- 1) Select the formula object in the spreadsheet.
- 2) Right-click on the formula and select **Anchor > To Page** or **To Cell** in the context menu
- 3) Alternatively, go to **Format > Anchor** on the Menu bar and select **To Page** or **To Cell**.

Tip

If you insert a formula into a Calc spreadsheet and it appears out of scale, you can fix it by right-clicking the formula object and then selecting the **Original Size** option in the context menu.

Draw and Impress

When a formula is inserted into a drawing or slide, it is inserted as a floating OLE object and is not anchored to any particular position in a drawing or slide.

Formula object properties

Formula objects in Calc, Draw, and Impress can be modified just like any other object that has been placed in your spreadsheet, drawing, or presentation, with the exception of formula object size and changing the format of any text within a formula. For more information on how to change object properties, see the *Calc Guide*, *Draw Guide* and *Impress Guide*.

The following points will help you select which dialog to use if you want to change the properties of formula objects.

- For formula backgrounds, use the various options in the tabs of the Area dialog.
- For formula borders, use the various options in the Line dialog. Note that formula borders are separate from cell borders in a Calc spreadsheet.
- To accurately re-position a formula object, use the various options in tabs of the Position and Size dialog.
- In Draw and Impress, you can arrange, align, group, flip, convert, break, combine, and edit points of formula objects.
- You cannot change the text attributes of a formula object. The text used in a formula is set when you create the formula in the Formula Editor.
- Formula object size is set by the formula font size when the formula is created in the Formula Editor. The formula object size is protected in the Position and Size dialog, but this can be deselected if you wish. However, this is not recommended as resizing a formula object using the Position and Size dialog could lead to distortion of a formula making it difficult to read.

Formulas in charts

A chart in a Calc spreadsheet is itself an OLE object, therefore, you cannot use the Formula Editor to create and insert a formula directly into a chart. However, you can create both the Chart and Math objects separately and later copy and paste the Math formula into the Chart object:

- 1) Create the chart using LibreOffice Calc. For a complete reference on how to create charts, see Chapter 3 in the *Calc Guide*.
- 2) Click at any cell in your spreadsheet so that the Chart is no longer selected.

- 3) Insert a Math Formula object by clicking **Insert > Object > Formula**.
- 4) Type the desired formula into the Formula Editor.
- 5) After editing the formula, select the Math Formula object and press *Ctrl+C* to copy the Formula object to the clipboard.
- 6) Double-click the chart object to start editing the chart and press *Ctrl+V* to paste the Formula object into the chart.
- 7) Now you can position the object anywhere you want inside the chart.

If you want to change the formula at a later date, then you must repeat the whole process of creating, copying, and pasting the Formula object into the chart.

Customization

This section explains how you can customize Math to suit the way you create formulas for use in LibreOffice documents. Also, refer to Chapter 14, Customizing LibreOffice, for more general information on how to customize LibreOffice.

Floating dialogs

The Formula Editor and Elements dock can cover a large part of your document. To help create more space and/or allow you to move either the Formula Editor or Elements dock out of the way, you can turn both of them into floating dialogs.

- 1) Position the cursor on the frame.
- 2) Hold down the *Ctrl* key and double-click. This turns the Formula Editor into the Commands dialog (Figure 17) and the Elements dock into the Elements dialog (Figure 18).

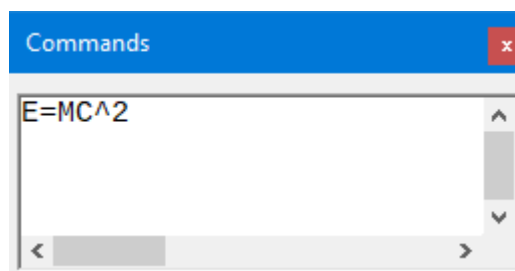

Figure 17: Commands dialog

Figure 18: Elements dialog

To return the Commands dialog and Elements dialog back to their default positions:

- 1) Position the cursor on the frame of the dialog, NOT the title bar at the top of the dialog.
- 2) Hold down the *Ctrl* key and double-click.

Adding keyboard shortcuts

You can add keyboard shortcuts to LibreOffice to make creating documents much easier and to match your workflow. See Chapter 14, *Customizing LibreOffice*, for instructions.

Catalog customization

If you regularly use a symbol that is not available in Math, you can add it to the Symbols dialog (Figure 19) by opening the Edit Symbols dialog (Figure 20).

Using the Edit Symbols dialog you can add symbols to a symbol set, edit symbol sets, or modify symbol notations. You can also define new symbol sets, assign names to symbols, or modify existing symbol sets.

Adding symbols

- 1) Go to **Tools > Symbols** on the Menu bar or click on the **Symbols** icon on the Tools toolbar to open the Symbols dialog.
- 2) Click the **Edit** button to open the Edit Symbols dialog.
- 3) Select a font in the *Font* drop-down list.
- 4) Select a symbol character that you want to add in the preview box. You may have to scroll down in the preview box to locate the symbol you want to use. The small right preview box displays the new symbol.
- 5) In the *Symbol* box, type a memorable name for the symbol you are adding.
- 6) In the *Symbol set* box, select a symbol set in the drop-down list to add your new symbol to, or type a new name to create a new symbol set for your new symbol.
- 7) If required, select a font style in the *Style* drop-down list – **Standard**, **Italic**, **Bold**, or **Bold, Italic**.
- 8) Click **Add**, then click **OK** to close the Edit Symbols dialog. The new symbol and, if created, new symbol set are now available for use.

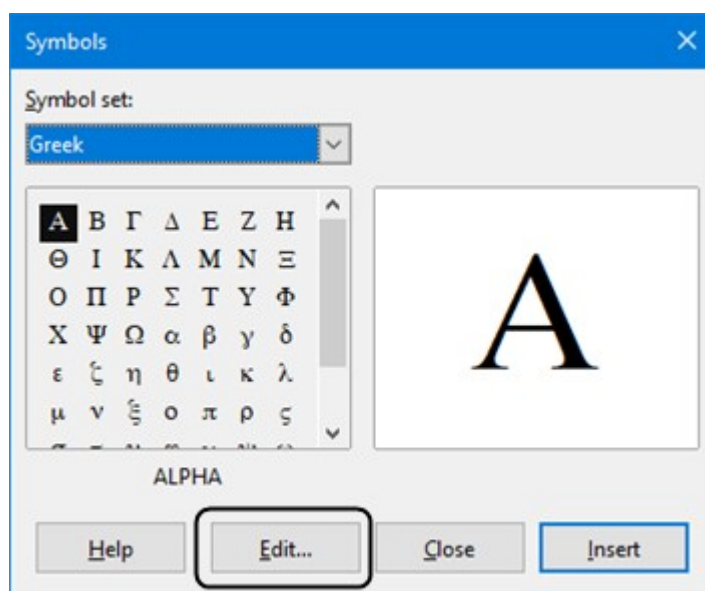

Figure 19: Symbols dialog

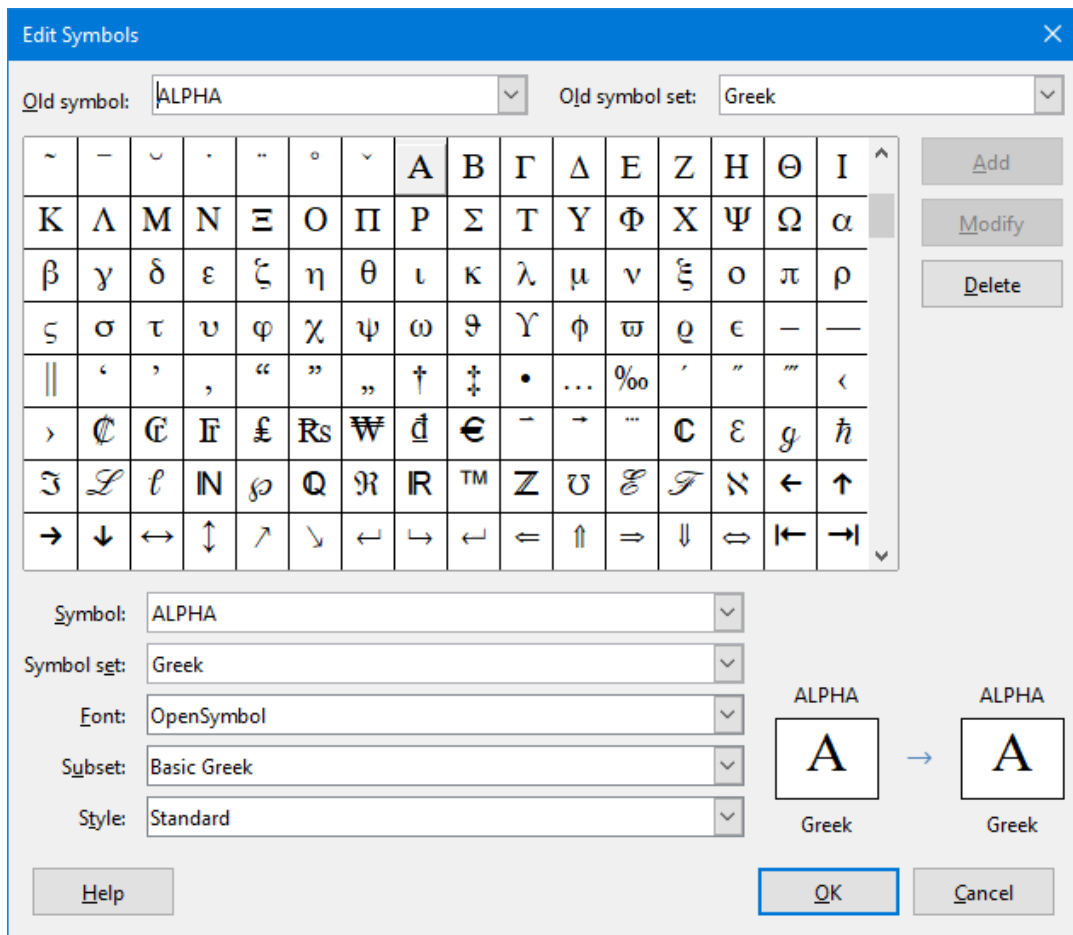

Figure 20: The Edit Symbols dialog

✓ Note

When a new symbol is added to the catalog, you can type a percentage sign (%) followed by the new name into the markup language in the Formula Editor and your new symbol will appear in your formula. Remember that symbol names are case sensitive, for example, %prime is a different symbol to %Prime.

✓ Note

There are numerous free fonts available that contain several symbols if you cannot find a symbol to use in the fonts already installed on your computer. For example, the STIX font was developed specially for writing mathematical and technical texts. Also, the DejaVu and Lucida fonts have a wide range of symbols that you can use.

✓ Note

When LibreOffice is installed on a computer, only those user-defined symbols that actually occur in the document are stored with it. Sometimes it is useful to embed all the user-defined symbols, so that when the document is transferred to another computer it can be edited by another person. Go to **Tools > Options > LibreOffice Math > Settings**, uncheck the option **Embed only used symbols (smaller file size)**. This setting is only available when you are working with LibreOffice Math.

Editing symbols

Modifying symbol names

You can change the name of a symbol as follows:

- 1) Select the symbol name you want to change in the *Old symbol* drop-down list. The symbol appears in the left preview pane at the bottom of the Edit Symbols dialog (Figure 20).
- 2) Type a new name for the symbol in the *Symbol* text box, or select a new name in the *Symbol* drop-down list. The new symbol name appears above the right preview pane at the bottom of the Edit Symbols dialog.
- 3) Click **Modify** and the symbol name is changed.
- 4) Click **OK** to close the Edit Symbols dialog.

Moving symbols

You can move a symbol from one symbol set to another as follows:

- 1) In the *Old symbol set* drop-down list, select the symbol set where the symbol you want to move is located.
- 2) Select the symbol name you want move in the *Old symbol* drop-down list. The symbol appears in the left preview pane at the bottom of the Edit Symbols dialog (Figure 20).
- 3) In the **Symbol set** drop-down list, select the symbol set that you want to move the symbol to. The new symbol set name appears below the right preview pane at the bottom of the Edit Symbols dialog.
- 4) Click **Modify** and the symbol is moved to the new symbol set
- 5) Click **OK** to close the Edit Symbols dialog.

Deleting symbols

You can delete a symbol from a symbol set as follows:

- 1) In the *Old symbol set* drop-down list, select the symbol set from which you want to delete the symbol.
- 2) Select the symbol name you want delete in the *Old symbol* drop-down list. The symbol appears in the left preview pane at the bottom of the Edit Symbols dialog (Figure 20).
- 3) Click **Delete** and the symbol is deleted from the symbol set without any confirmation.
- 4) Click **OK** to close the Edit Symbols dialog.

Note

The only way you can delete a symbol set is by deleting all of the symbols in that set. When you delete the last symbol from a set, the set is also deleted.

Options for editing symbols

For details of the fields in the Edit Symbols dialog (Figure 20), please refer to the *Math Guide*.

Formula spacing

The grave accent (˘) inserts an additional small space and the tilde (~) inserts an additional large space into formulas. However, in the basic installation of LibreOffice, these symbols are ignored when they occur at the end of a formula. If you are working with running text in a formula, it may be necessary to include spacing at the end of formulas as well. This customization is only required when you are working with a Math document and is not required when you are inserting a formula into another LibreOffice component.

To add spacing at the end of formula in Math, go to **Tools > Options > LibreOffice Math > Settings** on the Menu bar and uncheck **Ignore ~ and ` at the end of the line** in the *Miscellaneous Options* section.

Extensions

If you *create formulas* frequently in your documents, you can customize LibreOffice by adding extensions that are designed to help you create formulas. Extensions are easily installed using the Extension Manager. For more information on how to install extensions, see Chapter 14, Customizing LibreOffice.

A commonly used extension is **Formatting of All Math Formulas**. It allows you to format all Math formulas in your Writer, Calc, Draw or Impress document. With it you can change the font names and font sizes of all formulas in your document. For more information on this extension, go to <https://extensions.libreoffice.org/extensions/show/formatting-of-all-math-formulas>.

Exporting and Importing

Math ML format

In addition to exporting documents as PDFs, LibreOffice offers the possibility of saving formulas in the MathML format. This allows you or another person to insert formulas into documents that were created in other software, for example, Microsoft Office or an internet browser.

Note

Some internet browsers do not fully support the MathML format and your formula may not display correctly.

If you are working on a Math document, go to **File > Save as** on the Menu bar or use the keyboard combination *Ctrl+Shift+S* to open the Save as dialog. Select MathML in the list of available file formats in File type: to save your formula as MathML.

If you are working in another LibreOffice module, right-click on the formula object and select **Save copy as** in the context menu to open the Save as dialog. Select MathML in the list of available file formats in “File type” to save your formula object as MathML.

In Math you can also import MathML formulas. Use **Tools > Import MathML from clipboard** on the Menu bar.

Microsoft file formats

To control how formulas in Microsoft format are imported and exported using LibreOffice, go to **Tools > Options > Load/Save > Microsoft Office** on the Menu bar and select or deselect the options for *MathType to LibreOffice Math* or *reverse*.

- *[L]: Load and convert the object*
- *[S]: Convert and save the object*

[L]: Load and convert the object

Select this option if Microsoft OLE objects are to be converted into the specified LibreOffice OLE object when a Microsoft document is opened in LibreOffice. For formulas, any embedded MathType objects must not exceed the MathType 3.1 specifications to be successfully loaded and converted. Information on MathType format can be found on the website <http://www.dessci.com/en>.

If a document containing OMML formulas has been saved in .docx format and then converted to the older .doc format, then any OMML objects are converted into graphics, which will be displayed in LibreOffice as graphics.

[S]: Convert and save the object

Select this option if LibreOffice OLE objects are to be converted and saved in Microsoft file format. LibreOffice converts any formulas into a format that can be read and modified by Microsoft Equation Editor and MathType.

When this option is not selected, the formula is treated as an OLE object on conversion into a .doc format and remains linked to LibreOffice. A double-click on the object in Microsoft Office will attempt to launch LibreOffice.
